## Disclaimer

Please read these instructions carefully before using the equipment or taking any other actions with respect to the equipment. Only trained and qualified persons are allowed to perform installation, operation, service or maintenance of the equipment. Such qualified persons have the responsibility to take all appropriate measures, including e.g. use of authentication, encryption, anti-virus programs, safe switching programs etc. necessary to ensure a safe and secure environment and usability of the equipment. The warranty granted to the equipment remains in force only provided that the instructions contained in this document have been strictly complied with.

Nothing contained in this document shall increase the liability or extend the warranty obligations of the manufacturer Arcteq Relays Ltd. The manufacturer expressly disclaims any and all liability for any damages and/or losses caused due to a failure to comply with the instructions contained herein or caused by persons who do not fulfil the aforementioned requirements. Furthermore, the manufacturer shall not be liable for possible errors in this document.

Please note that you must always comply with applicable local legislation and regulations. The manufacturer gives no warranties that the content of this document is in all respects in line with local laws and regulations and assumes no liability for such possible deviations.

You are advised to notify the manufacturer in case you become aware of any errors in this document or of defects in the equipment.

The manufacturer reserves the right to update or amend this document at any time.

## 1.1 Version 2 revision notes

#### Table. 1.1 - 1. Version 2 revision notes

| Revision | 2.00  |  |
|----------|---|--|
| Date     | 6.6.2019  |  |
| Changes  | <ul> <li>New more consistent look.</li> <li>Improved descriptions generally in many chapters.</li> <li>Improved readability of a lot of drawings and images.</li> <li>Updated protection functions included in every manual.</li> <li>Every protection relay type now has connection drawing, application example drawing wit function block diagram and application example with wiring.</li> <li>Added General-menu description.</li> </ul> |  |
| Revision | 2.01  |  |
| Date     | 6.11.2019   |  |
| Changes  | <ul> <li>Added description for LED test and button test.</li> <li>Added display sleep timer description.</li> <li>Complete rewrite of every chapter.</li> <li>Improvements to many drawings and formula images.</li> <li>Order codes revised.</li> <li>Added double ST 100 Mbps Ethernet communication module and Double RJ45 10/100<br/>Mbps Ethernet communication module descriptions</li> </ul>   |  |
| Revision | 2.02  |  |
| Date     | 7.7.2020  |  |
| Changes  | - A number of image descriptions improved.  |  |
| Revision | 2.03  |  |
| Date     | 27.8.2020   |  |

Version: 2.12

|                             | - Terminology consistency improved (e.g. binary inputs are now always called digital inputs).   |  |  |
|-----------------------------|---|--|--|
| Changes                     | <ul> <li>Tech data modified to be more informative about what type of measurement inputs are used (phase currents/voltages, residual currents/voltages), what component of that measurement is available (RMS, TRMS, peak-to-peak) and possible calculated measurement values (powers, impedances, angles etc.).</li> <li>Improvements to many drawings and formula images.</li> <li>AQ-S254 Functions included list Added: Indicator objects.</li> <li>Event read mode parameter added to Modbus description.</li> <li>Added inches to Dimensions and installation chapter.</li> <li>Added raising frames, wall mounting bracket, combiflex frame to order code.</li> <li>Added logical input and logical output function descriptions.</li> <li>Added button test description to Local panel structure chapter.</li> <li>Added note to Configuring user levels and passwords chapter that AQ-250 frame units generate a time-stamped event from locking and unlocking user levels.</li> <li>Added note to Configuring user levels and passwords chapter that user level with a password automatically locks itself after 30 minutes of inactivity.</li> <li>Added more "Tripped stage" indications and fault types to Measurement value recorder function.</li> <li>Updated: Digital input activation and release threshold setting ranges and added drop-off delay setting.</li> </ul> |  |  |
| Revision                    | 2.04  |  |  |
| Date                        | 8.6.2021  |  |  |
| Changes                     | <ul> <li>Increased the consistency in terminology</li> <li>Various image upgrades</li> <li>Visual update to the order codes</li> </ul>  |  |  |
|                             |   |  |  |
| Revision                    | 2.05  |  |  |
| Revision<br>Date            |   |  |  |
|                             | 2.05  |  |  |
| Date                        | 2.05         22.6.2021         - Fixed phase current measurement continuous thermal withstand from 30A to 20A.         - Fixed lots of timing errors written to registers table. "Prefault" is -200 ms from Start event, "Pretrigger" is -20 ms from trip (or start if fault doensn't progress to trip), "Fault" is start (or trip if fault doesn't progress to trip).  |  |  |
| Date<br>Changes             | <ul> <li>2.05</li> <li>22.6.2021</li> <li>Fixed phase current measurement continuous thermal withstand from 30A to 20A.</li> <li>Fixed lots of timing errors written to registers table. "Prefault" is -200 ms from Start event, "Pretrigger" is -20 ms from trip (or start if fault doensn't progress to trip), "Fault" is start (or trip if fault doesn't progress to trip).</li> <li>Added event history technical data</li> </ul>   |  |  |
| Date<br>Changes<br>Revision | 2.05         22.6.2021         - Fixed phase current measurement continuous thermal withstand from 30A to 20A.         - Fixed lots of timing errors written to registers table. ## 1.2 Version 1 revision notes

Table. 1.2 - 2. Version 1 revision notes

Revision 1.00

| Date     | 15.1.2018                             |  |  |
|----------|---------------------------------------|--|--|
| Changes  | The first revision for AQ-S254.       |  |  |
| Revision | 1.01                                  |  |  |
| Date     | 18.1.2019                             |  |  |
| Changes  | Added the HMI display technical data. |  |  |

## 1.3 Safety information

This document contains important instructions that should be saved for future use. Read the document carefully before installing, operating, servicing, or maintaining this equipment. Please read and follow all the instructions carefully to prevent accidents, injury and damage to property.

Additionally, this document contains four (4) types of special messages to call the reader's attention to useful information as follows:

#### NOTICE!

"Notice" messages indicate relevant factors and conditions to the the concept discussed in the text, as well as to other relevant advice.

#### CAUTION!

"Caution" messages indicate a potentially hazardous situation which, if not avoided, **could** result in minor or moderate personal injury, in equipment/property damage, or software corruption.

#### WARNING!

"Warning" messages indicate a potentially hazardous situation which, if not avoided, **could** result in death or serious personal injury as well as serious damage to equipment/property.

#### DANGER!

"Danger" messages indicate an imminently hazardous situation which, if not avoided, will result in death or serious personal injury.

These symbols are added throughout the document to ensure all users' personal safety and to avoid unintentional damage to the equipment or connected devices.

Please note that although these warnings relate to direct damage to personnel and/or equipment, it should be understood that operating damaged equipment may also lead to further, indirect damage to personnel and/or equipment. Therefore, we expect any user to fully comply with these special messages.

## 1.4 Abbreviations

AI – Analog input

AR – Auto-recloser

ASDU - Application service data unit

AVR - Automatic voltage regulator

- BCD Binary-coded decimal
- CB Circuit breaker
- CBFP Circuit breaker failure protection
- CLPU Cold load pick-up
- CPU Central processing unit
- CT Current transformer
- CTM Current transformer module
- CTS Current transformer supervision
- DG Distributed generation
- DHCP Dynamic Host Configuration Protocol
- DI Digital input
- DO Digital output
- DOL Direct-on-line
- DR Disturbance recorder
- DT Definite time
- FF Fundamental frequency
- FFT Fast Fourier transform
- FTP File Transfer Protocol
- GI General interrogation
- HMI Human-machine interface
- HR Holding register
- HV High voltage
- HW Hardware
- IDMT Inverse definite minimum time
- IGBT Insulated-gate bipolar transistor
- I/O Input and output
- IRIG-B Inter-range instruction group, timecode B
- LCD Liquid-crystal display
- LED Light emitting diode
- LV Low voltage
- NC Normally closed

- NO Normally open
- NTP Network Time Protocol
- RMS Root mean square
- RSTP Rapid Spanning Tree Protocol
- RTD Resistance temperature detector
- RTU Remote terminal unit
- SCADA Supervisory control and data acquisition
- SG Setting group
- SOTF Switch-on-to-fault
- SW Software
- THD Total harmonic distortion
- TRMS True root mean square
- VT Voltage transformer
- VTM Voltage transformer module
- VTS Voltage transformer supervision

## 2 General

The AQ-S254 alarm and indication unit is a member of the AQ 250 product line. The hardware and software are modular: the hardware modules are assembled and configured according to the application's I/O requirements and the software determines the available functions. This manual describes the specific application of the AQ-S254 alarm and indication unit. For other AQ 200 and AQ 250 series products please consult their respective device manuals.

AQ-S254 may be applied as a substation alarm sounder, a substation general I/O extension unit or in any other application that requires extended I/O capabilities. The local indications are visualized conveniently through the freely programmable alarm display and event list. There are up to fourteen (14) option card slots available for additional I/O or communication cards for more comprehensive monitoring and control applications. AQ-S254 can be connected to a substation automation system by using various standard communication protocols, including the IEC 61850 substation communication standard.

# 3 Device user interface

## 3.1 Panel structure

The user interface section of an AQ 200 or AQ 250 series device is divided into two user interface sections: one for the hardware and the other for the software. You can access the software interface either through the front panel or through the AQtivate 200 freeware software suite.

## 3.1.1 Local panel structure

The front panel of AQ-250 series devices have multiple LEDs, control buttons and a local RJ-45 Ethernet port for configuration. Each unit is also equipped with an RS-485 serial interface and an RJ-45 Ethernet interface on the back of the device.

Figure. 3.1.1 - 1. Local panel structure.

- 1. Four (4) default LEDs: "Power", "Error", "Start" (configurable) and "Trip" (configurable).
- 2. Sixteen (16) freely configurable LEDs (red, orange, green) with programmable legend texts.
- 3. Three (3) object control buttons: Choose the controllable object with the Ctrl button and control the breaker or other object with the I and the O buttons.
- 4. The L/R button switches between the local and the remote control modes.
- 5. Eight (8) buttons for device local programming: the four navigation arrows, the **Back** and the **OK** buttons, the **Home** and the password activation buttons).
- 6. Twelve (12) freely configurable function buttons (F1...F12). Each button has a freely configurable LED (red, orange, green).
- 7. One (1) RJ-45 Ethernet port for device configuration.

When the unit is powered on, the green "Power" LED is lit. When the red "Error" LED is lit, the device has an internal (hardware or software) error that affects the operation of the unit. The activation of the yellow "Start" LED and the red "Trip" LED are based on the setting the user has put in place in the software.

The sixteen freely configurable LEDs are located on the left side of the display. Their activation and color (green, orange, red) are based on the settings the user has put in place in the software.

The view in the screen is freely configurable. Virtual switches and buttons can be added which can be used to change the setting groups or control the device's general logic locally or remotely. The status of the object (circuit breaker, disconnector) can be displayed on the screen. All measured and calculated values regardless of the magnitude catecory (current, voltage, power, energy, frequency, etc.) can be shown on the screen.

Holding the I (object control) button down for five seconds brings up the button test menu. It displays all the physical buttons on the front panel. Pressing any of the listed buttons marks them as tested. When all buttons are marked as having been tested, the device will return back to the default view.

## 3.2 Configuring user levels and their passwords

As a factory default, no user level is locked with a password in a device. In order to activate the different user levels, click the Lock button in the device's HMI and set the desired passwords for the different user levels.

## NOTICE!

Passwords can only be set locally in an HMI.

A number of stars are displayed in the upper right corner of the HMI; these indicate the current user level. The different user levels and their star indicators are as follows (also, see the image below for the HMI view):

- Super user (\*\*\*)
- Configurator (\*\*)
- Operator (\*)
- User (-)

You can set a new password for a user level by selecting the key icon next to the user level's name. After this you can lock the user level by pressing the **Return** key while the lock is selected. If you need to change the password, you can select the key icon again and give a new password. To remove the password, set the password to "0" (zero). Please note that in order to do this the user level whose password is being changed must be unlocked.

As mentioned above, the access level of the different user levels is indicated by the number of stars. The required access level to change a parameter is indicated with a star (\*) symbol if such is required. As a general rule the access levels are divided as follows:

- User: Can view any menus and settings but cannot change any settings, nor operate breakers or other equipment.
- *Operator:* Can view any menus and settings but cannot change any settings BUT can operate breakers and other equipment.
- *Configurator:* Can change most settings such as basic protection pick-up levels or time delays, breaker control functions, signal descriptions etc. and can operate breakers and other equipment.
- Super user: Can change any setting and can operate breakers and other equipment.

#### NOTICE!

Unlocking and locking a user level generates a time-stamped event to the event log in all AQ 250 series devices.

#### NOTICE!

Any user level with a password automatically locks itself after half an hour (30 minutes) of inactivity.

# 4 Functions

## 4.1 Functions included in AQ-S254

The AQ-S254 alarm and indication device includes the following functions as well as the number of stages in those functions.

Table. 4.1 - 3. Alarming functions of AQ-S254.

| Name      | IEC    | ANSI | Description                    |
|-----------|--------|------|--------------------------------|
| ALARM     | -      | -    | Alarming function (128 alarms) |
| PGS (110) | PGx>/< | 99   | Programmable stage             |

#### Table. 4.1 - 4. Control functions of AQ-S254.

| Name | IEC | ANSI | Description  |
|------|-----|------|--|
| OBJ  | -   | -    | Object control and monitoring<br>(10 objects available)  |
| CIN  | -   | -    | Indicator object monitoring<br>(20 indicators available) |

Table. 4.1 - 5. Transducer functions of AQ-S254.

| Name      | IEC | ANSI | Description                                  |
|-----------|-----|------|--|
| RTD (116) | -   | -    | RTD alarms (Resistance temperature detector) |

Table. 4.1 - 6. Monitoring functions of AQ-S214.

| Name | IEC | ANSI | Description          |
|------|-----|------|----------------------|
| DR   | -   | -    | Disturbance recorder |

## 4.2 General menu

The *General* menu consists of basic settings and indications of the device. Additionally, the all activated functions and their status are displayed in the *Protection*, *Control* and *Monitor* profiles.

| Name             | Description  |
|------------------|--|
| Serial number    | The unique serial number identification of the unit. |
| Firmware version | The firmware software version of the unit.           |

| Name                                      | Description  |
|---|--|
| Hardware configuration                    | The order code identification of the unit.   |
| System phase rotating order at the moment | The selected system phase rotating order. Can be changed with parameter "System phase rotating order". |
| UTC time                                  | The UTC time value which the device's clock uses.  |

Table. 4.2 - 8. Parameters and indications in the *General* menu.

| Name                                      | Range  | Default      | Description   |  |  |
|---|--|--------------|---|--|--|
| Device name                               | -  | Unitname     | The file name uses these fields when leading the large  |  |  |
| Device<br>location                        | -  | Unitlocation | The file name uses these fields when loading the .aqs configuration file from the AQ-200 unit.  |  |  |
| Enable stage<br>forcing                   | <ul><li>Disabled</li><li>Enabled</li></ul>   | Disabled     | When this parameter is enabled it is possible for the user to force the protection, control and monitoring functions to different statuses like START and TRIP. This is done in the function's <i>Info</i> page with the <i>Force status to</i> parameter.            |  |  |
| Allow setting<br>of device<br>mode        | <ul> <li>Prohibited</li> <li>From HMI/<br/>setting tool<br/>only</li> <li>Allowed</li> </ul>   | Prohibited   | Allows global mode to be modified from setting tool, HMI and IEC61850.<br>Prohibited: Cannot be changed.<br>From HMI/setting tool only: Can only be changed from the setting tool or HMI<br>Allowed: Can be changed from the setting tool, HMI, and IEC 61850 client. |  |  |
| Allow setting<br>of individual<br>LN mode | <ul> <li>Prohibited</li> <li>From HMI/<br/>setting tool<br/>only</li> <li>Allowed</li> </ul>   | Prohibited   | Allow local modes to be modified from setting tool, HMI and IEC61850.<br>Prohibited: Cannot be changed.<br>From HMI/setting tool only: Can only be changed from the setting tool or HMI<br>Allowed: Can be changed from the setting tool, HMI, and IEC 61850 client.  |  |  |
| System<br>phase<br>rotating order         | • A-B-C<br>• A-C-B   | A-B-C        | Allows the user to switch the expected order in which the phase measurements are wired to the unit.   |  |  |
| Language                                  | <ul> <li>User<br/>defined</li> <li>English</li> <li>Finnish</li> <li>Chinese</li> <li>Spanish</li> <li>French</li> <li>German</li> <li>Russian</li> <li>Ukrainian</li> <li>Kazakh</li> </ul> | English      | Changes the language of the parameter descriptions in the<br>HMI. If the language has been set to "Other" in the settings of<br>the AQtivate setting tool, AQtivate follows the value set into this<br>parameter.   |  |  |
| AQtivate<br>ethernet port                 | <ul> <li>All</li> <li>COM A</li> <li>Double<br/>Ethernet<br/>card</li> </ul>   | All          | If the device has a double Ethernet option card it is possible to<br>choose which ports are available for connecting with AQtivate<br>software.   |  |  |

| Name                               | Range   | Default     | Description  |  |
|------------------------------------|---|-------------|--|--|
| Clear events                       | • -<br>• Clear  | -           | Clears the event history recorded in the AQ-200 device.  |  |
| Display<br>brightness              | 08  | 4           | Changes the display brightness. Brightness level 0 turns the display off.  |  |
| Display sleep<br>timeout           | 03600s  | 0s          | If no buttons are pressed after a set time, the display changes<br>the brightness to whatever is set on the "Display sleep<br>brightness" parameter. If set to 0 s, this feature is not in use.<br>When the device is in sleep mode pressing any of the buttons<br>on the front panel of the device will wake the display. |  |
| Display sleep<br>brightness        | 08  | 0           | Defines the brightness of the display when the set display sleep<br>timeout has elapsed. The brightness level "0" turns the display<br>off.  |  |
| Return to<br>default view          | 03600s  | Os          | If the user navigates to a menu and gives no input after a period<br>of time defined with this parameter, the unit automatically<br>returns to the default view. If set to 0 s, this feature is not in use.  |  |
| LED test                           | <ul><li> -</li><li>Activated</li></ul>  | -           | When activated, all LEDs are lit up. LEDs with multiple possible colors blink each color.  |  |
| HMI restart                        | <ul><li>-</li><li>Restart</li></ul>   | -           | When activated, display restarts.  |  |
| Display color<br>theme             | <ul><li>Light theme</li><li>Dark theme</li></ul>  | Light theme | Defines the color theme used in the HMI.   |  |
| Reset latches                      | • -<br>• Reset  | -           | Resets the latched signals in the logic and the matrix. When a reset command is given, the parameter automatically returns back to "-".  |  |
| Measurement recorder               | <ul><li>Disabled</li><li>Enabled</li></ul>  | Disabled    | Enables the measurement recorder tool, further configured in Tools $\rightarrow$ Misc $\rightarrow$ Measurement recorder.  |  |
| Clear active<br>alarms             | <ul><li>Disabled</li><li>Enabled</li></ul>  | Disabled    | Enables the clearing of those alarms that still have an activation signal on. If an alarm is cleared while its activation signal is active, the alarm will go to the "active cleared" status.  |  |
| I/0 default<br>object<br>selection | <ul> <li>OBJ1</li> <li>OBJ2</li> <li>OBJ3</li> <li>OBJ4</li> <li>OBJ5</li> <li>OBJ6</li> <li>OBJ7</li> <li>OBJ8</li> <li>OBJ9</li> <li>OBJ10</li> </ul> | OBJ1        | "I" and "0" push buttons on the front panel of the device have an<br>indication LED. This parameter defines which objects' status<br>push buttons follow when lighting up the LEDs.  |  |
| Device Mode                        | <ul> <li>On</li> <li>Blocked</li> <li>Test</li> <li>Test/<br/>Blocked</li> <li>Off</li> </ul>   | On          | Set mode of device block.<br>This parameter is visible only when <i>Allow setting of device</i><br><i>mode</i> is enabled in <i>General</i> menu.  |  |

| Name                 | Range                                    | Default | Description                    |
|----------------------|--|---------|--------------------------------|
| Reconfigure<br>mimic | <ul><li> -</li><li>Reconfigure</li></ul> | -       | Reloads the mimic to the unit. |

#### Table. 4.2 - 9. General menu logical inputs.

| Name  | Description  |
|---|--|
| Reset last fault registers                    | Signal set to this point can be used for resetting latest recorded fault register.   |
| Reset latches                                 | Signals set to this point can be used for resetting latched signals. An alternative to using the "Back" button on the front panel of the device. |
| Ph.Rotating Logic control<br>0=A-B-C, 1=A-C-B | Signals set to this point can be used for switching the expected phase rotating order.   |

| 0<br>           | Alarm 29                               | Alarm 30                               | Alarm 31<br>16/01/2018<br>19:20:32.000 | Alarm 32                               | F6 F12 |
| ) — L           | eds                                    | 15:0                                   | )6:25                                  | Events                                 |        |
| -               |  |  |  | _ [                                    | €) G   |
|                 |  |  |  |  |        |

Signal alarming is the main feature of AQ-S254 Alarming devices. The alarming unit has 128 alarms the user can set. The user defines each alarm description and activating signal. These settings are done in the *Alarm settings* menu (*Control*  $\rightarrow$  *Device I*/*O*  $\rightarrow$  *Alarm settings*).

The alarming unit generates events with time stamps into the event history and the alarm statuses are shown on the device's display. The alarm statuses can also be read in the remote terminal unit (RTU).

#### Alarm descriptions

The user-edited alarm text is displayed in the *Alarm* view in the HMI when the alarm has been activated. The user can update the descriptions in the settings (*Commands*  $\rightarrow$  *Write to relay*  $\rightarrow$  *Parameters or Commands*  $\rightarrow$  *Write changes*).

Table. 4.3 - 10. Alarm user description.

| Name                | Range      | Default | Description   |
|---------------------|------------|---------|---|
| User editable       | 131        | Alarm   | Description of the alarm. This description is used in several menu types for easier identification. |
| description Alarm x | characters | x       |   |

## Assigning alarm activation signals

Alarm activation signals are divided into eight tabs in groups of 16. The user can assign a digital input, a logic signal or a GOOSE message into each of the alarms. When any of the alarms have been activated by the assigned signal, the alarm appears in the *Alarms* view in the device's HMI.

Figure. 4.3 - 3. Digital inputs assigned as alarm activating signals.

The user can assign signals into alarms by clicking on the matrix. When the matrix is done, it must be sent to the device for the changes to take effect (*Commands*  $\rightarrow$  *Write to relay*  $\rightarrow$  *Logic*).

If the alarm signal's ON state has been checked in the *Event Mask*, an ALARM ON event is recorded with a time stamp into the event history. These alarms are also reported in the communication protocol if one is in use.

Figure. 4.3 - 4. Carousel designer view of the *Alarms* view settings.

Changing the look of the Alarms viewis done in Carousel designer. Carousel designer is found in Tools  $\rightarrow$  Carousel designer.

The column and row settings allow the user to define the size, shape and number of alarms displayed in the *Alarms* view. Any number of alarms between 1 and 128 can be displayed. The color displayed in different states of the alarm can be gray, red, green, yellow, orange, or blue.

| Parameter | Description   |
|-----------|---|
| Pages     | Number of pages used. Pages can be scrolled with left and right arrow buttons. Each page used as many columns and rows as is defined with following two parameters. |
| Columns   | Number of columns used per page.  |
| Rows      | Number of rows used per page.   |

Table. 4.3 - 11. Alarm view settings

| Parameter   | Description   |
|---|---|
| Inactive color.   | Color displayed for an alarm that hasn't been activated.  |
| Active color.   | Color displayed for an alarm that has a signal currently active.  |
| Active cleared color.                                   | Color displayed for an alarm that has a signal currently active AND it has been acknowledged with "Reset command". If "Reset command" is given the alarm will return to "Inactive color" when the activating signal is reset too. |
| Inactive uncleared color.                               | Color displayed for an alarm that had a signal active in the past but hasn't been acknowledged with "Reset command" yet. After "Reset command" is given the alarm will return to "Inactive color".                                |
| Active / Active<br>cleared / Inactive<br>uncleared mode | Selection between solid and blinking modes. If blinking mode is selected the color of alarm will alternate between its color and inacive color.   |
| Blinking frequency                                      | Sets how frequently blinking states switch colors.  |
| Zoom pop-up   | When enabled pressing up arrow button will zoom alarm boxes. Zoomed alarm can then be selected with up, down, left and right arrow buttons. Press back-button to exit zoomed view.  |

Figure. 4.3 - 5. Alarm color behaviour with active alarm clearing enabled and disabled.

By default active alarms cannot be cleared. This can be changed by setting *Clear active* alarms to *Enabled* at *General*  $\rightarrow$  *Device info* menu. When enabled the alarms otherwise change color just the same way as with default settings but it is also possible to clear an alarm while the activation signal is still active. If alarm is cleared when signal is active, color will change to what has been set to *Active cleared color* in Carousel designer (orange by default).

## Alarm zooming

If *Zoom popup* parameter is enabled in *Carousel designer* menu it is possible to enlarge alarms by pressing the up-arrow button. Once in zoomed mode direction arrows up, down, left and right can be used for choosing the alarm. Use Back-button to exit zoomed mode.

| Alarm 1    | m 2                             | Alarm 3             | Alarm 4   | Alarm 5   | Alarm 6   | Alarm 7   | Alarm 8   |

Figure. 4.3 - 7. Alarm 1 is zoomed

## Clearing activated alarms

Figure. 4.3 - 8. Setting up the button for clearing alarms.

The button used for clearing alarms is defined in *Control*  $\rightarrow$  *Device*  $I/O \rightarrow$  *Alarm settings*  $\rightarrow$  *Function Button Settings*. Please notice that the function button mode should be set to PRESS RELEASE mode in *Control*  $\rightarrow$  *Device*  $I/O \rightarrow$  *User-button settings*.

Alarms can be also cleared by using the CLEAR ALL ALARMS signal in the logic editor. In the example below, a physical push button activates Digital Input 1 which is connected to CLEAR ALL ALARMS.

After doing this in the logic editor, click *Save* and then update logic (*Commands*  $\rightarrow$  *Write to relay*  $\rightarrow$  *Logic*).

## Buzzer activation and deactivation

AQ-S214 and AQ-S254 Alarming devices do not have an integrated buzzer. However, if an alarming buzzer is needed it is possible to connect an external buzzer. It is activated by one of the output relays of the device. The user can set up the buzzer control by connecting the ALARM BUZZER signal to an output (*Control*  $\rightarrow$  *Device I/O*  $\rightarrow$  *Device IO Matrix*). Whenever an alarm is activated the ALARM BUZZER signal will also activate and the output contact can be controlled.

The user can silence the alarm buzzer by pressing the **Back** button located in the front panel, or by connecting a digital input or some other binary signal in the logic to SILENCE ALARM BUZZER.

## **Clearing latched alarms**

Figure. 4.3 - 9. Latched signals as dots.

| Control Settings   |
|--|
| 🤗 Controls Enabled  Objects 🎬 Device IO  |
| DeviceIO   |
| 💧 🚺 Binary Inputs 💧 Binary Outputs 🔍 Alarm Settings 🌢 Device IO Matrix 🚺 Programmable C  |
| Alarm Settings   |
| 💧 🚺 Alarm Description Settings 🌢 Function Button Settings 🕚 Alarms 1-16 🚺 Alarms 17-32 🚺 |
| Show connected only  |
| Inputs U Breaker open U Gas alarm U RTU fault  |
| DI1  |
| DI2  |
| DI3  |
| Open control button  |
| Close control button   |

Latched signals are represented by filled markers in the matrix.

If a latched signals is connected to an alarm, the alarm unit requires the user to push the **Back** button in the unit's front panel before the latched signal can be cleared. Using latched signals is generally not advised in order to keep alarm clearing simple.

#### **Events**

The alarm function generates events from the status changes in the monitored signals. The user can select which event messages are stored in the main event buffer: ON, OFF, or both.

Table. 4.3 - 12. Event messages.

| Event block name | Event name      |
|------------------|-----------------|
| ALARM1           | Alarm 132 ON    |
| ALARM1           | Alarm 132 OFF   |
| ALARM2           | Alarm 3364 ON   |
| ALARM2           | Alarm 3364 OFF  |
| ALARM3           | Alarm 6596 ON   |
| ALARM3           | Alarm 6596 OFF  |
| ALARM4           | Alarm 97128 ON  |
| ALARM4           | Alarm 97128 OFF |

## 4.4 Control functions

## 4.4.1 Setting group selection

All device types support up to eight (8) separate setting groups. The Setting group selection function block controls the availability and selection of the setting groups. By default, only Setting group 1 (SG1) is active and therefore the selection logic is idle. When more than one setting group is enabled, the setting group selector logic takes control of the setting group activations based on the logic and conditions the user has programmed.

Figure. 4.4.1 - 10. Simplified function block diagram of the setting group selection function.

AQ-2xx Protection relay platform - Protection CPU

Setting group selection can be applied to each of the setting groups individually by activating one of the various internal logic inputs and connected digital inputs. The user can also force any of the setting groups on when the "Force SG change" setting is enabled by giving the wanted quantity of setting groups as a number in the communication bus or in the local HMI, or by selecting the wanted setting group from *Control*  $\rightarrow$  *Setting groups*. When the forcing parameter is enabled, the automatic control of the local device is overridden and the full control of the setting groups is given to the user until the "Force SG change" is disabled again.

Setting groups can be controlled either by pulses or by signal levels. The setting group controller block gives setting groups priority values for situations when more than one setting group is controlled at the same time: the request from a higher-priority setting group is taken into use.

Setting groups follow a hierarchy in which setting group 1 has the highest priority, setting group 2 has second highest priority etc. If a static activation signal is given for two setting groups, the setting group with higher priority will be active. If setting groups are controlled by pulses, the setting group activated by pulse will stay active until another setting groups receives and activation signal.

Figure. 4.4.1 - 11. Example sequences of group changing (control with pulse only, or with both pulses and static signals).

## Settings and signals

The settings of the setting group control function include the active setting group selection, the forced setting group selection, the enabling (or disabling) of the forced change, the selection of the number of active setting groups in the application, as well as the selection of the setting group changed remotely. If the setting group is forced to change, the corresponding setting group must be enabled and the force change must be enabled. Then, the setting group can be set from communications or from HMI to any available group. If the setting group control is applied with static signals right after the "Force SG" parameter is released, the application takes control of the setting group selection.

Table. 4.4.1 - 13. Settings of the setting group selection function.

| Name                    | Range  | Default | Description                             |
|-------------------------|--|---------|---|
| Active setting<br>group | <ul> <li>SG1</li> <li>SG2</li> <li>SG3</li> <li>SG4</li> <li>SG5</li> <li>SG6</li> <li>SG7</li> <li>SG8</li> </ul> | SG1     | Displays which setting group is active. |

| Name                              | Range  | Default  | Description  |
|-----------------------------------|--|----------|--|
| Force setting<br>group            | <ul> <li>None</li> <li>SG1</li> <li>SG2</li> <li>SG3</li> <li>SG4</li> <li>SG5</li> <li>SG6</li> <li>SG7</li> <li>SG8</li> </ul> | None     | The selection of the overriding setting group. After "Force SG change" is enabled, any of the configured setting groups in the device can be overriden. This control is always based on the pulse operating mode. It also requires that the selected setting group is specifically controlled to ON after "Force SG" is disabled. If there are no other controls, the last set setting group remains active. |
| Force setting group change        | <ul><li>Disabled</li><li>Enabled</li></ul>   | Disabled | The selection of whether the setting group forcing is enabled or<br>disabled. This setting has to be active before the setting group can be<br>changed remotely or from a local HMI. This parameter overrides the<br>local control of the setting groups and it remains on until the user<br>disables it.  |
| Used setting<br>groups            | <ul> <li>SG1</li> <li>SG12</li> <li>SG13</li> <li>SG14</li> <li>SG15</li> <li>SG16</li> <li>SG17</li> <li>SG18</li> </ul>        | SG1      | The selection of the activated setting groups in the application.<br>Newly-enabled setting groups use default parameter values.  |
| Remote<br>setting<br>group change | <ul> <li>None</li> <li>SG1</li> <li>SG2</li> <li>SG3</li> <li>SG4</li> <li>SG5</li> <li>SG6</li> <li>SG7</li> <li>SG8</li> </ul> | None     | This parameter can be controlled through SCADA to change the<br>setting group remotely. Please note that if a higher priority setting<br>group is being controlled by a signal, a lower priority setting group<br>cannot be activated with this parameter.   |

Table. 4.4.1 - 14. Signals of the setting group selection function.

| Name                  | Description  |
|-----------------------|--|
| Setting<br>group<br>1 | The selection of Setting group 1 ("SG1"). Has the highest priority input in setting group control. Can be controlled with pulses or static signals. If static signal control is applied, no other SG requests will be processed.   |
| Setting<br>group<br>2 | The selection of Setting group 2 ("SG2"). Has the second highest priority input in setting group control. Can be controlled with pulses or static signals. If static signal control is applied, no requests with a lower priority than SG1 will be processed.                    |
| Setting<br>group<br>3 | The selection of Setting group 3 ("SG3"). Has the third highest priority input in setting group control. Can be controlled with pulses or static signals. If static signal control is applied, no requests with a lower priority than SG1 and SG2 will be processed.             |
| Setting<br>group<br>4 | The selection of Setting group 4 ("SG4"). Has the fourth highest priority input in setting group control.<br>Can be controlled with pulses or static signals. If static signal control is applied, no requests with a<br>lower priority than SG1, SG2 and SG3 will be processed. |
| Setting<br>group<br>5 | The selection of Setting group 5 ("SG5"). Has the fourth lowest priority input in setting group control.<br>Can be controlled with pulses or static signals. If static signal control is applied, SG6, SG7 and SG8<br>requests will not be processed.                            |

4 Functions

Version: 2.12

| Name                  | Description  |
|-----------------------|--|
| Setting<br>group<br>6 | The selection of Setting group 6 ("SG6"). Has the third lowest priority input in setting group control.<br>Can be controlled with pulses or static signals. If static signal control is applied, SG7 and SG8 requests will not be processed.   |
| Setting<br>group<br>7 | The selection of Setting group 7 ("SG7"). Has the second lowest priority input in setting group control.<br>Can be controlled with pulses or static signals. If static signal control is applied, only SG8 requests will<br>not be processed.  |
| Setting<br>group<br>8 | The selection of Setting group 8 ("SG8"). Has the lowest priority input in setting group control. Can be controlled with pulses or static signals. If static signal control is applied, all other SG requests will be processed regardless of the signal status of this setting group. |

## Example applications for setting group control

This chapter presents some of the most common applications for setting group changing requirements.

A Petersen coil compensated network usually uses directional sensitive earth fault protection. The user needs to control its characteristics between varmetric and wattmetric; the selection is based on whether the Petersen coil is connected when the network is compensated, or whether it is open when the network is unearthed.

Figure. 4.4.1 - 12. Setting group control – one-wire connection from Petersen coil status.

Depending on the application's requirements, the setting group control can be applied either with a one-wire connection or with a two-wire connection by monitoring the state of the Petersen coil connection.

When the connection is done with one wire, the setting group change logic can be applied as shown in the figure above. The status of the Petersen coil controls whether Setting group 1 is active. If the coil is disconnected, Setting group 2 is active. This way, if the wire is broken for some reason, the setting group is always controlled to SG2.

Figure. 4.4.1 - 13. Setting group control – two-wire connection from Petersen coil status.

Figure. 4.4.1 - 14. Setting group control – two-wire connection from Petersen coil status with additional logic.

The images above depict a two-wire connection from the Petersen coil: the two images at the top show a direct connection, while the two images on the bottom include additional logic. With a two-wire connection the state of the Petersen coil can be monitored more securely. The additional logic ensures that a single wire loss will not affect the correct setting group selection.

The application-controlled setting group change can also be applied entirely from the device's internal logics. For example, the setting group change can be based on the cold load pick-up function (see the image below).

Figure. 4.4.1 - 15. Entirely application-controlled setting group change with the cold load pick-up function.

In these examples the cold load pick-up function's output is used for the automatic setting group change. Similarly to this application, any combination of the signals available in the device's database can be programmed to be used in the setting group selection logic.

As all these examples show, setting group selection with application control has to be built fully before they can be used for setting group control. The setting group does not change back to SG1 unless it is controlled back to SG1 by this application; this explains the inverted signal NOT as well as the use of logics in setting group control. One could also have SG2 be the primary SG, while the ON signal would be controlled by the higher priority SG1; this way the setting group would automatically return to SG2 after the automatic control is over.

#### **Events**

The setting group selection function block (abbreviated "SGS" in event block names) generates events from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

| Event block name | Event names                 |  |  |
|------------------|-----------------------------|--|--|
| SGS              | SG28 Enabled                |  |  |
| SGS              | SG28 Disabled               |  |  |
| SGS              | SG18 Request ON             |  |  |
| SGS              | SG18 Request OFF            |  |  |
| SGS              | Remote Change SG Request ON |  |  |

Table. 4.4.1 - 15. Event messages.

| Event block name | Event names                             |
|------------------|---|
| SGS              | Remote Change SG Request OFF            |
| SGS              | Local Change SG Request ON              |
| SGS              | Local Change SG Request OFF             |
| SGS              | Force Change SG ON                      |
| SGS              | Force Change SG OFF                     |
| SGS              | SG Request Fail Not configured SG ON    |
| SGS              | SG Request Fail Not configured SG OFF   |
| SGS              | Force Request Fail Force ON             |
| SGS              | Force Request Fail Force OFF            |
| SGS              | SG Req. Fail Lower priority Request ON  |
| SGS              | SG Req. Fail Lower priority Request OFF |
| SGS              | SG18 Active ON                          |
| SGS              | SG18 Active OFF                         |

## 4.4.2 Object control and monitoring

The object control and monitoring function takes care of both for circuit breakers and disconnectors. The monitoring and controlling are based on the statuses of the device's configured digital inputs and outputs. The number of controllable and monitored objects in each device depends on the device type and amount of digital inputs. One controllable object requires a minimum of two (2) output contacts. The status monitoring of one monitored object usually requires two (2) digital inputs. Alternatively, object status monitoring can be performed with a single digital input: the input's active state and its zero state (switched to 1 with a NOT gate in the Logic editor).

An object can be controlled manually or automatically. Manual control can be done by local control, or by remote control. Local manual control can be done by devices front panel (HMI) or by external push buttons connected to devices digital inputs. Manual remote control can be done through one of the various communication protocols available (Modbus, IEC101/103/104 etc.). The function supports the modes "Direct control" and "Select before execute" while controlled remotely. Automatic controlling can be done with functions like auto-reclosing function (ANSI 79).

The main outputs of the function are the OBJECT OPEN and OBJECT CLOSE control signals. Additionally, the function reports the monitored object's status and applied operations. The setting parameters are static inputs for the function, which can only be changed by the user in the function's setup phase.

Figure. 4.4.2 - 16. Simplified function block diagram of the object control and monitoring function.

## **Settings**

The following parameters help the user to define the object. The operation of the function varies based on these settings and the selected object type. The selected object type determines how much control is needed and which setting parameters are required to meet those needs.

Table. 4.4.2 - 16. Object settings and status parameters.

| Name                      | Range  | Default | Description  |
|---------------------------|--|---------|--|
| Local/Remote<br>status    | <ul><li>Local</li><li>Remote</li></ul>   | Remote  | Displays the status of the device's "local/remote" switch. Local controls cannot override the open and close commands while device is in "Remote" status. The remote controls cannot override the open and close commands while device is in "Local" status. |
| Object status<br>force to | <ul> <li>Normal</li> <li>Openreq On</li> <li>Closereq On</li> <li>Opensignal On</li> <li>Closesignal On</li> <li>Closesignal On</li> <li>WaitNoRdy On</li> <li>WaitNoSnc On</li> <li>NotrdyFail On</li> <li>NosyncFail On</li> <li>Opentout On</li> <li>Clotout On</li> <li>OpenreqUSR<br/>On</li> <li>CloreqUSR On</li> </ul> | Normal  | Force the status of the function. Visible only when <i>Enable stage forcing</i> parameter is enabled in <i>General</i> menu.   |
| OBJ LN mode               | <ul> <li>On</li> <li>Blocked</li> <li>Test</li> <li>Test/Blocked</li> <li>Off</li> </ul>   | On      | Set mode of OBJ block.<br>This parameter is visible only when <i>Allow setting of individual</i><br><i>LN mode</i> is enabled in <i>General</i> menu.  |

| Name                                | Range  | Default            | Description  |
|-------------------------------------|--|--------------------|--|
| OBJ LN<br>behaviour                 | <ul> <li>On</li> <li>Blocked</li> <li>Test</li> <li>Test/Blocked</li> <li>Off</li> </ul>   | -                  | Displays the mode of OBJ block.<br>This parameter is visible only when <i>Allow setting of individual</i><br><i>LN mode</i> is enabled in <i>General</i> menu.   |
| Object name                         | -  | Objectx            | The user-set name of the object, at maximum 32 characters long.  |
| Object type                         | <ul> <li>Withdrawable<br/>circuit breaker</li> <li>Circuit breaker</li> <li>Disconnector<br/>(MC)</li> <li>Disconnector<br/>(GND)</li> </ul>   | Circuit<br>breaker | The selection of the object type. This selection defines the<br>number of required digital inputs for the monitored object. This<br>affects the symbol displayed in the HMI and the monitoring of<br>the circuit breaker. It also affects whether the withdrawable<br>cart is in/out status is monitored. See the next table ("Object<br>types") for a more detailed look at which functionalities each of<br>the object types have. |
| Objectx<br>Breaker<br>status        | <ul><li>Intermediate</li><li>Open</li><li>Closed</li><li>Bad</li></ul>   | -                  | Displays the status of breaker. Intermediate is displayed when<br>neither of the status signals (open or close) are active. Bad<br>status is displayed when both status signals (open and close)<br>are active.  |
| Objectx<br>Withdraw<br>status       | <ul> <li>WDIntermediate</li> <li>WDCartOut</li> <li>WDCart In</li> <li>WDBad</li> <li>Not in use</li> </ul>  | -                  | Displays the status of circuit breaker cart. WDIntermediate is<br>displayed when neither of the status signals (in or out) are<br>active. WDBad status is displayed when both status signals<br>(in and out) are active. If the selected object type is not set to<br>"Withdrawable circuit breaker", this setting displays the "No in<br>use" option.   |
| Additional<br>status<br>information | <ul> <li>Open Blocked</li> <li>Open Allowed</li> <li>Close Blocked</li> <li>Close Allowed</li> <li>Object Ready</li> <li>Object Not<br/>Ready</li> <li>Sync Ok</li> <li>Sync Not Ok</li> </ul> | -                  | Displays additional information about the status of the object.  |
| Use<br>Synchrocheck                 | <ul> <li>Not in use</li> <li>Synchrocheck<br/>in use</li> </ul>  | Not in<br>use      | Selects whether the "Synchrocheck" condition is in use for the circuit breaker close command. If "In use" is selected the input chosen to "Sync.check status in" has to be active to be able to close circuit breaker.<br>Synchrocheck status can be either an internal signal generated by synchrocheck function or digital input activation with an external synchrocheck device.  |
| Use Object<br>ready                 | <ul><li>Ready High</li><li>Ready Low</li><li>Not in use</li></ul>  | Not in<br>use      | Selects whether the "Object ready" condition is in use for the circuit breaker close command. If in use the signal connected to "Object ready status In" has to be high or low to be able to close the breaker (depending on "Ready High or Low" selection).   |
| Open<br>requests                    | 02 <sup>32</sup> –1  | -                  | Displays the number of successful "Open" requests.   |
| Close<br>requests                   | 02 <sup>32</sup> –1  | -                  | Displays the number of successful "Close" requests.  |

| Name                        | Range               | Default | Description   |
|-----------------------------|---------------------|---------|---|
| Open<br>requests<br>failed  | 02 <sup>32</sup> –1 | -       | Displays the number of failed "Open" requests.  |
| Close<br>requests<br>failed | 02 <sup>32</sup> –1 | -       | Displays the number of failed "Close" requests.   |
| Clear<br>statistics         | • -<br>• Clear      | -       | Clears the request statistics, setting them back to zero (0).<br>Automatically returns to "-" after the clearing is finished. |

#### Table. 4.4.2 - 17. Object types.

| Name                            | Functionalities   | Description  |
|---------------------------------|---|--|
| Withdrawable circuit<br>breaker | Breaker cart position<br>Circuit breaker position<br>Circuit breaker control<br>Object ready check before<br>closing breaker<br>Synchrochecking before<br>closing breaker<br>Interlocks | The monitor and control configuration of the withdrawable circuit breaker. |
| Circuit breaker                 | Position indication<br>Control<br>Object ready check before<br>closing breaker<br>Synchrochecking before<br>closing breaker<br>Interlocks   | The monitor and control configuration of the circuit breaker.              |
| Disconnector (MC)               | Position indication<br>Control  | The position monitoring and control of the disconnector.                   |
| Disconnector (GND)              | Position indication   | The position indication of the earth switch.                               |

Table. 4.4.2 - 18. I/O.

| Signal  | Range   | Description   |
|---|---|---|
| Objectx Open input<br>("Objectx Open Status<br>In")   | Digital input or other<br>logical signal<br>selected by the user<br>(SWx) | A link to a physical digital input. The monitored object's OPEN status. "1" refers to the active open state of the monitored object.                |
| Objectx Close input<br>("Objectx Close Status<br>In") |   | A link to a physical digital input. The monitored object's CLOSE status. "1" refers to the active close state of the monitored object.              |
| WD Object In<br>("Withdrw.CartIn.Status<br>In")       |   | A link to a physical digital input. The monitored withdrawable object's position is IN. "1" means that the withdrawable object cart is in.          |
| WD Object Out<br>("Withdrw.CartOut.Status<br>In")     |   | A link to a physical digital input. The monitored withdrawable object's position is OUT. "1" means that the withdrawable object cart is pulled out. |

| Signal  | Range    | Description  |
|---|----------|--|
| Object Ready<br>(Objectx Ready status<br>In")         |          | A link to a physical digital input. Indicates that status of the<br>monitored object. "1" means that the object is ready and the<br>spring is charged for a close command. |
| Syncrocheck permission<br>("Sync.Check status In")    |          | A link to a physical digital input or a synchrocheck function.<br>"1" means that the synchrocheck conditions are met and the<br>object can be closed.                      |
| Objectx Open command<br>("Objectx Open<br>Command")   |          | The physical "Open" command pulse to the device's output relay.  |
| Objectx Close command<br>("Objectx Close<br>Command") | OUT1OUTx | The physical "Close" command pulse to the device's output relay.   |

#### Table. 4.4.2 - 19. Operation settings.

| Name   | Range           | Step      | Default | Description   |
|--|-----------------|-----------|---------|---|
| Breaker<br>traverse<br>time                    | 0.02500.00<br>s | 0.02<br>s | 0.2 s   | Determines the maximum time between open and close statuses<br>when the breaker switches. If this set time is exceeded and both<br>open and closed status inputs are active, the status "Bad" is<br>activated in the "Objectx Breaker status" setting. If neither of the<br>status inputs are active after this delay, the status "Intermediate" is<br>activated. |
| Maximum<br>Close<br>command<br>pulse<br>length | 0.02500.00<br>s | 0.02<br>s | 0.2 s   | Determines the maximum length for a Close pulse from the output<br>relay to the controlled object. If the object operates faster than this<br>set time, the control pulse is reset and a status change is<br>detected.  |
| Maximum<br>Open<br>command<br>pulse<br>length  | 0.02500.00<br>s | 0.02<br>s | 0.2 s   | Determines the maximum length for a Open pulse from the output<br>relay to the controlled object. If the object operates faster than this<br>set time, the control pulse is reset and a status change is<br>detected.   |
| Control<br>termination<br>timeout              | 0.02500.00<br>s | 0.02<br>s | 10 s    | Determines the control pulse termination timeout. If the object has<br>not changed it status in this given time the function will issue error<br>event and the control is ended. This parameter is common for<br>both open and close commands.  |
| Final trip<br>pulse<br>length                  | 0.00500.00<br>s | 0.02<br>s | 0.2 s   | Determines the length of the final trip pulse length. When the object has executed the final trip, this signal activates. If set to 0 s, the signal is continuous. If auto-recloser function controls the object, "final trip" signal is activated only when there are no automatic reclosings expected after opening the breaker.                                |

Table. 4.4.2 - 20. Control settings (DI and Application).

| Signal                         | Range   | Description  |
|--------------------------------|---|--|
| Access level for MIMIC control | <ul><li>User</li><li>Operator</li><li>Configurator</li><li>Super user</li></ul> | Defines what level of access is required for MIMIC control. The default is the "Configurator" level. |

| Signal                                   | Range   | Description   |  |  |
|--|---|---|--|--|
| Objectx LOCAL<br>Close control input     |   | The local Close command from a physical digital input (e.g. a push button). |  |  |
| Objectx LOCAL<br>Open control input      | Digital input or other logical<br>signal selected by the user | The local Open command from a physical digital input (e.g. a push button).  |  |  |
| Objectx<br>REMOTE Close control<br>input |   | The remote Close command from a physical digital input (e.g. RTU).          |  |  |
| Objectx REMOTE<br>Open control input     |   | The remote Open command from a physical digital input (e.g. RTU).           |  |  |
| Objectx Application<br>Close             |   | The Close command from the application. Can be any logical signal.          |  |  |
| Objectx Application<br>Open              |   | The Close command from the application. Can be any logical signal.          |  |  |

# Blocking and interlocking

The interlocking and blocking conditions can be set for each controllable object, with Open and Close set separately. Blocking and interlocking can be based on any of the following: other object statuses, a software function or a digital input.

The image below presents an example of an interlock application, where the closed earthing switch interlocks the circuit breaker close command.

In order for the blocking signal to be received on time, it has to reach the function 5 ms before the control command.

# Object condition monitoring (circuit breaker wear monitor)

Each object has integrated circuit breaker wear monitor. The circuit breaker wear function is used for monitoring the circuit breaker's lifetime and its maintenance needs caused by interrupting currents and mechanical wear. The function uses the circuit breaker's manufacturer-supplied data for the breaker operating cycles in relation to the interrupted current magnitudes.

Figure. 4.4.2 - 18. Example of the circuit breaker interrupting life operations. Points 1 and 2 are user settable.

The function is triggered from the circuit breaker's "Open" command output and it monitors the threephase current values in both the tripping moment and the normal breaker opening moment. The maximum value of interrupting life operations for each phase is calculated from these currents. The value is cumulatively deducted from the starting operations starting value. The user can set up two separate alarm levels, which are activated when the value of interrupting life operations is below the setting limit. The "Trip contact" setting defines the output that triggers the current monitoring at the breaker's "Open" command. The function's outputs are ALARM 1 and ALARM 2 signals which can be used for direct I/O controlling and user logic programming.

The function block uses analog current measurement values and always uses the RMS magnitude of the current measurement input.

| Signal | Description                             | Time base |
|--------|---|-----------|
| IL1RMS | RMS measurement of phase L1 (A) current | 5ms       |
| IL2RMS | RMS measurement of phase L2 (B) current | 5ms       |
| IL3RMS | RMS measurement of phase L3 (C) current | 5ms       |

| Table. 4.4.2 - 2 | 1. Measurement | inputs of the | circuit breake | r wear function. |
|------------------|----------------|---------------|----------------|------------------|
|------------------|----------------|---------------|----------------|------------------|

Condition monitoring parameters can be found from Control  $\rightarrow$  Objects  $\rightarrow$  Object X  $\rightarrow$  APP CONTR  $\rightarrow$  Condition Monitoring.

Table. 4.4.2 - 22. Breaker supervision settings and status indications.

| Name                 | Range                                      | Default  | Description  |
|----------------------|--|----------|--|
| Condition monitoring | <ul><li>Disabled</li><li>Enabled</li></ul> | Disabled | Enabled the breaker condition monitoring function. |

| Name  | Range  | Default                     | Description  |  |  |
|---|--|-----------------------------|--|--|--|
| Condition monitor status                    | <ul> <li>Normal</li> <li>Alarm1<br/>On</li> <li>Alarm2<br/>On</li> </ul> | -                           | Displays the status of the monitor.  |  |  |
| Open operations                             | 04 294 967<br>295  | -                           | Displays the total amount of breaker open operations.                                  |  |  |
| Operation time open                         | 04 294 967<br>295 ms   | -                           | Displays the latest breaker opening time.  |  |  |
| Close operations                            | 04 294 967<br>295  | -                           | Displays the total amount of breaker close operations.                                 |  |  |
| Operation time close                        | 04 294 967<br>295 ms   | -                           | Displays the latest breaker closing time.  |  |  |
| L1 Operations Left                          |  |                             |  |  |  |
| L2 Operations Left                          | 04 294 967 295   | -                           | Displays the amount of operations left in each phase.                                  |  |  |
| L3 Operations Left                          |  |                             |  |  |  |
| Object Cumulated operations                 | 04 294 967<br>295  | -                           | Displays the total amount of operations.   |  |  |
| Clear condition monitoring statistics       | • -<br>• Clear   | -                           | Clears the operation statistics.   |  |  |
| Operations with Current 1<br>Value allowed  | 0200 000   | 50000                       | Defines the amount of operations with lower current values. See figure above.          |  |  |
| Current 1 Value                             | 0.00100.00<br>kA   | 1.00 kA                     | Defines the lower current turnpoint. See figure above.                                 |  |  |
| Operations with Current 2<br>Value allowed  | 0200 000   | 100                         | Defines amount of operations with higher current values. See figure above.             |  |  |
| Current 2 Value                             | 0.00100.00<br>kA   | 20.00<br>kA                 | Defines the higher current turnpoint. See figure above.                                |  |  |
| Condition Alarm 1 Enable                    | <ul><li>Disabled</li><li>Enabled</li></ul>                               | Lijeshlad I Enshlas Alarm 1 |  |  |  |
| Condition Alarm 1 when operations less than | 0200 000   | 1000                        | When the amount of operations left is less than value set here, Alarm 1 will activate. |  |  |
| Condition Alarm 2 Enable                    | <ul><li>Disabled</li><li>Enabled</li></ul>                               | Disabled                    | Enables Alarm 2.   |  |  |
| Condition Alarm 2 when operations less than | 0200 000   | 100                         | When the amount of operations left is less than value set here, Alarm 2 will activate. |  |  |

# Events and registers

The object control and monitoring function (abbreviated "OBJ" in event block names) generates events and registers from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

The function also provides a resettable cumulative counter for OPEN, CLOSE, OPEN FAILED, and CLOSE FAILED events.

| Event block name | Description         |
|------------------|---------------------|
| OBJ1OBJ10        | Object Intermediate |
| OBJ1OBJ10        | Object Open         |
| OBJ1OBJ10        | Object Close        |
| OBJ1OBJ10        | Object Bad          |
| OBJ1OBJ10        | WD Intermediate     |
| OBJ1OBJ10        | WD Out              |
| OBJ1OBJ10        | WD in               |
| OBJ1OBJ10        | WD Bad              |
| OBJ1OBJ10        | Open Request On     |
| OBJ1OBJ10        | Open Request Off    |
| OBJ1OBJ10        | Open Command On     |
| OBJ1OBJ10        | Open Command Off    |
| OBJ1OBJ10        | Close Request On    |
| OBJ1OBJ10        | Close Request Off   |
| OBJ1OBJ10        | Close Command On    |
| OBJ1OBJ10        | Close Command Off   |
| OBJ1OBJ10        | Open Blocked On     |
| OBJ1OBJ10        | Open Blocked Off    |
| OBJ1OBJ10        | Close Blocked On    |
| OBJ1OBJ10        | Close Blocked Off   |
| OBJ1OBJ10        | Object Ready        |
| OBJ1OBJ10        | Object Not Ready    |
| OBJ1OBJ10        | Sync Ok             |
| OBJ1OBJ10        | Sync Not Ok         |

Table. 4.4.2 - 23. Event messages of the OBJ function instances 1 - 10.

| Event block name | Description                        |  |
|------------------|------------------------------------|--|
| OBJ1OBJ10        | Open Command Fail                  |  |
| OBJ1OBJ10        | Close Command Fail                 |  |
| OBJ1OBJ10        | Final trip On                      |  |

| OBJ1OBJ10        | XCBR Loc Off                       |  |
| OBJ1OBJ10        | XSWI Loc On                        |  |
| OBJ1OBJ10        | XSWI LOC Off                       |  |

The function registers its operation into the last twelve (12) time-stamped registers. The table below presents the structure of the function's register content.

Table. 4.4.2 - 24. Register content.

| Name                            | Description  |  |
|---------------------------------|--|--|
| Date and time                   | dd.mm.yyyy hh:mm:ss.mss  |  |
| Event                           | Event name   |  |
| Recorded<br>Object opening time | Time difference between the object receiving an "Open" command and the object receiving the "Open" status. |  |
| Recorded<br>Object closing time | Time difference between the object receiving a "Close" command and object receiving the "Closed" status.   |  |
| Object status                   | The status of the object.  |  |
| WD status                       | The status of the withdrawable circuit breaker.  |  |
| Open fail                       | The cause of an "Open" command's failure.  |  |
| Close fail                      | The cause of a "Close" command's failure.  |  |
| Open command                    | The source of an "Open" command.   |  |
| Close command                   | The source of an "Open" command.   |  |
| General status                  | The general status of the function.  |  |

# 4.4.3 Indicator object monitoring

The indicator object monitoring function takes care of the status monitoring of disconnectors. The function's sole purpose is indication and does not therefore have any control functionality. To control circuit breakers and/or disconnectors, please use the Object control and monitoring function. The monitoring is based on the statuses of the configured device's digital inputs. The number of monitored indicators in a device depends on the device type and available inputs. The status monitoring can be performed with a single digital input: the input's active state and its zero state (switched to 1 with a NOT gate in the Logic editor).

The outputs of the function are the monitored indicator statuses (Open, Close, Intermediate and Bad). The setting parameters are static inputs for the function, which can only be changed by the use in the function's setup phase.

The inputs of the function are the binary status indications. The function generates general time stamped ON/OFF events to the common event buffer from each of the following signals: OPEN, CLOSE, BAD and INTERMEDIATE event signals. The time stamp resolution is 1 ms.

### **Settings**

Function uses available hardware and software digital signal statuses. These input signals are also setting parameters for the function.

| Name  | Range  | Default | Description  |
|---|--|---------|--|
| Indicator<br>name<br>("Ind. Name")                        | -  | IndX    | The user-set name of the object, at maximum 32 characters long.  |
| IndicatorX<br>Object status<br>("Ind.X Object<br>Status") | <ul><li>Intermediate</li><li>Open</li><li>Closed</li><li>Bad</li></ul> | -       | Displays the status of the indicator object. Intermediate status is<br>displayed when neither of the status conditions (open or close) are<br>active. Bad status is displayed when both of the status conditions<br>(open and close) are active. |

Table. 4.4.3 - 25. Indicator status.

Table. 4.4.3 - 26. Indicator I/O.

| Signal   | Range  | Description  |
|--|--|--|
| IndicatorX<br>Open input<br>("Ind.X<br>Open<br>Status In")   | Digital input or other logical<br>signal selected by the user<br>(SWx) | A link to a physical digital input. The monitored indicator's OPEN status. "1" refers to the active "Open" state of the monitored indicator.         |
| IndicatorX<br>Close input<br>("Ind.X<br>Close<br>Status In") | Digital input or other logical<br>signal selected by the user<br>(SWx) | A link to a physical digital input. The monitored indicator's<br>CLOSE status. "1" refers to the active "Close" state of the monitored<br>indicator. |

### **Events**

The indicator object monitoring function (abbreviated "CIN" in event block names) generates events from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

Table. 4.4.3 - 27. Event messages (instances 1-20).

| Event block name | Event names  |
|------------------|--------------|
| CIN120           | Intermediate |
| CIN120           | Open         |
| CIN120           | Close        |
| CIN120           | Bad          |

# 4.4.4 Milliampere output control

The milliamp current loop is the prevailing process control signal in many industries. It is an ideal method of transferring process information because a current does not change as it travels from a transmitter to a receiver. It is also much more simple and cost-effective.

The benefits of 4...20 mA loops:

- the dominant standard in many industries
- the simplest option to connect and configure
- uses less wiring and connections than other signals, thus greatly reducing initial setup costs
- good for travelling long distances, as current does not degrade over long connections like voltage does
- less sensitive to background electrical noise
- detects a fault in the system incredibly easily since 4 mA is equal to 0 % output.

# Milliampere (mA) outputs

AQ-200 series supports up to two (2) independent mA option cards. Each card has four (4) mA output channels and one (1) mA input channel. If the device has an mA option card, enable mA outputs at *Control*  $\rightarrow$  *Device IO*  $\rightarrow$  *mA outputs*. The outputs are activated in groups of two: channels 1 and 2 are activated together, as are channels 3 and 4.

| Name      |                                      | Range                                      | Default  | Description                             |
|-----------|--------------------------------------|--|----------|---|
| mA option | Enable mA output<br>channels 1 and 2 |  |          | Enables and disables the outputs of     |
| card 1    | Enable mA<br>output channels 3 and 4 | <ul><li>Disabled</li><li>Enabled</li></ul> | Disabled | the mA output card 1.                   |
| mA option | Enable mA output channels 5 and 6    | Disabled                                   | Disabled | Enables and disables the outputs of the |
| card 2    |                                      |  | Disabled | mA output card 2.                       |

Table. 4.4.4 - 28. Main settings (output channels).

#### Table. 4.4.4 - 29. Settings for mA output channels.

| Name  | Range   | Step     | Default   | Description  |
|---|---|----------|---|--|
| Enable<br>mA output<br>channel                        | <ul><li>Disabled</li><li>Enabled</li></ul>  | -        | Disabled  | Enables and disables the selected mA output<br>channel. If the channel is disabled, the channel<br>settings are hidden.  |

# 4.4.5 Programmable control switch

The programmable control switch is a control function that controls its binary output signal. This output signal can be controlled locally from the device's mimic (displayed as a box in the mimic) or remotely from the RTU. The main purpose of programmable control switches is to block or enable function and to change function properties by changing the setting group. However, this binary signal can also be used for any number of other purposes, just like all other binary signals. Once a programmable control switch has been activated or disabled, it remains in that state until given a new command to switch to the opposite state (see the image below). The switch cannot be controlled by an auxiliary input, such as digital inputs or logic signals; it can only be controlled locally (mimic) or remotely (RTU).

PCS status PCS activation command PCS deactivation command

### Settings.

These settings can be accessed at Control  $\rightarrow$  Device I/O  $\rightarrow$  Programmable control switch.

#### Table. 4.4.5 - 32. Settings.

| Name                                 | Range  | Default      | Description  |
|--------------------------------------|--|--------------|--|
| Switch name                          | -  | Switchx      | The user-settable name of the selected switch. The name can be up to 32 characters long.                       |
| Access level<br>for Mimic<br>control | <ul> <li>User</li> <li>Operator</li> <li>Configurator</li> <li>Super user</li> </ul> | Configurator | Determines which access level is required to be able to control the programmable control switch via the Mimic. |

### **Events**

The programmable control switch function (abbreviated "PCS" in event block names) generates events from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp. The function offers five (5) independent switches. The function's output signals can be used for direct I/O controlling and user logic programming.

#### Table. 4.4.5 - 33. Event messages.

| Event block name | Event names  |
|------------------|--------------|
| PCS              | Switch 1 ON  |
| PCS              | Switch 1 OFF |
| PCS              | Switch 2 ON  |
| PCS              | Switch 2 OFF |
| PCS              | Switch 3 ON  |
| PCS              | Switch 3 OFF |
| PCS              | Switch 4 ON  |
| PCS              | Switch 4 OFF |
| PCS              | Switch 5 ON  |
| PCS              | Switch 5 OFF |

# 4.4.6 User buttons

AQ-250 devices have twelve (12) physical user buttons in the front panel of the device. The main purpose of user buttons is to block or enable functions and to change function properties by changing the setting group. However, this binary signal can also be used for any number of other purposes, just like all other binary signals. Push buttons have two operation modes: "Press release" and "Toggle On/Off". In "Press release" mode the push button status is active while the button is pressed down. In "Toggle On/Off" mode push button status toggles between "On" and "Off". Each button has a user configurable LED at the top left corner of the button. The LED can be configured to activate red, orange or green color from button status or any other logical binary signal.

General user button settings and LED activation settings can be set at *Control*  $\rightarrow$  *Device IO*  $\rightarrow$  *Userbutton Settings*.

### NOTICE!

Status of push button output can only be controlled from the AQ-200 device front panel i.e. can't be controlled remotely. Therefore it is recommended to use "a virtual button" (programmable control switches or logical inputs) if a toggleable signal must be controlled both locally and remotely.

#### Table. 4.4.6 - 34. User button settings

| Name                                   | Range                                | Step | Default          | Description   |
|--|--------------------------------------|------|------------------|---|
| User<br>editable<br>description<br>112 | -                                    | -    | BTN112           | Description of the button. If "Function button" view has been added to the "Carousel design", these descriptions are used for the buttons.  |
| Mode of<br>Push-<br>button             | Press<br>release<br>Toggle<br>On/Off | -    | Press<br>release | Defines the operation mode of the button. In "Press release" mode the<br>button signal is active while the button is pressed down. In "Toggle<br>On/Off" mode the button signal changes status between "On" and<br>"Off" each time the button is pressed. |

#### Table. 4.4.6 - 35. User button output signals

| Signal name                | Description                      |
|----------------------------|----------------------------------|
| Status Push-button 112 On  | "On" status of each push-button  |
| Status Push-button 112 Off | "Off" status of each push-button |

# 4.4.7 Analog input scaling curves

Sometimes when measuring with RTD inputs, milliampere inputs and digital inputs the measurement might be inaccurate because the signal coming from the source is inaccurate. One common example of this is tap changer location indication signal not changing linearly from step to step. If the output difference between the steps are not equal to each other, measuring the incoming signal accurately is not enough. "Analog input scaling curves" menu can be used to take these inaccuracies into account.

Analog input scaling curve settings can be found at *Measurement*  $\rightarrow$  *AI(mA, DI volt) scaling* menu.

Currently following measurements can be scaled with analog input scaling curves:

- RTD inputs and mA inputs in "RTD & mA input" option cards
- mA inputs in "4x mA output & 1x mA input" option cards
- mA input in "4x mA input & 1x mA output" option cards
- Digital input voltages

| Name                    | Range  | Step | Default  | Description   |
|-------------------------|--|------|----------|---|
| Analog input<br>scaling | <ul><li>Disabled</li><li>Activated</li></ul> | -    | Disabled | Enables and disables the input.                                   |
| Scaling curve<br>110    | <ul><li>Disabled</li><li>Activated</li></ul> | -    | Disabled | Enables and disables the scaling curve and the input measurement. |

Table. 4.4.7 - 36. Main settings (input channel).

| Curve110 output                                   | -1 000<br>000.001 000<br>000.00   | 0.00001 | -              | Displays the output of the curve.   |

The input signal filtering parameter calculates the average of received signals according to the set time constant. This is why rapid changes and disturbances (such as fast spikes) are smothered. The Nyquist rate states that the filter time constant must be at least double the period time of the disturbance process signal. For example, the value for the filter time constant is 2 seconds for a 1 second period time of a disturbance oscillation.

$$H(s) = \frac{Wc}{S+Wc} = \frac{1}{1+s/Wc}$$

When the curve signal is out of range, it activates the "ASC1...10 input out of range" signal, which can be used inside logic or with other functions of the device. The signal can be assigned directly to an output relay or to an LED in the I/O matrix. The "Out of range" signal is activated, when the measured signal falls below the set input minimum limit, or when it exceeds the input maximum limit.

If for some reason the input signal is lost, the value is fixed to the last actual measured cycle value. The value does not go down to the minimum if it has been something else at the time of the signal breaking.

| Name                         | Range   | Step        | Default           | Description  |
|------------------------------|---|-------------|-------------------|--|
| Curve<br>110 update<br>cycle | 510 000ms   | 5ms         | 150ms             | Defines the length of the input measurement update cycle. If<br>the user wants a fast operation, this setting should be fairly<br>low. |
| Scaled value<br>handling     | <ul> <li>Floating<br/>point</li> <li>Integer<br/>out<br/>(Floor)</li> <li>Integer<br/>(Ceiling)</li> <li>Integer<br/>(Nearest)</li> </ul> | -           | Floating<br>point | Rounds the milliampere signal output as selected.  |
| Input value 1                | 04000   | 0.000<br>01 | 0                 | The measured input value at Curve Point 1.   |
| Scaled<br>output value<br>1  |   |             | 0                 | Scales the measured milliampere signal at Point 1.   |
| Input value 2                | 04000   | 0.000<br>01 | 1                 | The measured input value at Curve Point 2.   |

| Add<br>curvepoint<br>320     | <ul><li>Not used</li><li>Used</li></ul>   | -           | Not<br>used       | Allows the user to create their own curve with up to twenty (20) curve points, instead of using a linear curve between two points.     |

Table. 4.4.7 - 37. Output settings and indications.

# 4.4.8 Logical outputs

Logical outputs are used for sending binary signals out from a logic that has been built in the logic editor. Logical signals can be used for blocking functions, changing setting groups, controlling digital outputs, activating LEDs, etc. The status of logical outputs can also be reported to a SCADA system. 64 logical outputs are available. The figure below presents a logic output example where a signal from the circuit breaker failure protection function controls the digital output relay number 3 ("OUT3") when the circuit breaker's cart status is "In".

Figure. 4.4.8 - 20. Logic output example. Logical output is connected to an output relay in matrix.

# Logical output descriptions

Logical outputs can be given a description. The user defined description are displayed in most of the menus:

- logic editor
- matrix
- · block settings
- event history
- disturbance recordings
- etc.

Table. 4.4.8 - 38. Logical output user description.

| Name                                  | Range             | Default                  | Description  |
|---------------------------------------|-------------------|--------------------------|--|
| User editable<br>description<br>LO164 | 131<br>characters | Logical<br>output<br>164 | Description of the logical output. This description is used in several menu types for easier identification. |

### NOTICE!

After editing user descriptions the event history will start to use the new description only after resetting the HMI. HMI can be reset from *General*  $\rightarrow$  *Device info*  $\rightarrow$  *HMI restart*.

### **Events**

The logical outputs (abbreviated "LOGIC" in event block names) generates events from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp. The function's output signals can be used for direct I/O controlling and user logic programming.

#### Table. 4.4.8 - 39. Event messages.

| Event block name | Event names          |
|------------------|----------------------|
| LOGIC1           | Logical out 132 ON   |
| LOGIC1           | Logical out 132 OFF  |
| LOGIC3           | Logical out 3364 ON  |
| LOGIC3           | Logical out 3364 OFF |

# 4.4.9 Logical inputs

Logical inputs are binary signals that a user can control manually to change the behavior of the AQ-200 unit or to give direct control commands. Logical inputs can be controlled with a virtual switch built in the mimic and from a SCADA system. Logical inputs are volatile signals: their status will always return to "0" when the AQ-200 device is rebooted. 32 logical inputs are available.

Logical inputs have two modes available: Hold and Pulse. When a logical input which has been set to "Hold" mode is controlled to "1", the input will switch to status "1" and it stays in that status until it is given a control command to go to status "0" or until the device is rebooted. When a logical input which has been set to "Pulse" mode is controlled to "1", the input will switch to status "1" and return back to "0" after 5 ms.

The figure below presents the operation of a logical input in Hold mode and in Pulse mode.

Figure. 4.4.9 - 21. Operation of logical input in "Hold" and "Pulse" modes.

Logical input control "0" command Logical input control "1" command Logical input status "Hold" mode Logical input status "Pulse" mode 5 ms

A logical input pulse can also be extended by connecting a DELAY-low gate to a logical output, as has been done in the example figure below.

Figure. 4.4.9 - 22. Extending a logical input pulse.

# Logical input control "1" command 1 Logical input status "Pulse" mode 5 ms Logical output status Del

Delay low setting

# Logical input descriptions

Logical inputs can be given a description. The user defined description are displayed in most of the menus:

- logic editor
- matrix
- block settings
- event history
- disturbance recordings
- etc.

Table. 4.4.9 - 40. Logical input user description.

| Name                            | Range             | Default                 | Description   |
|---------------------------------|-------------------|-------------------------|---|
| User editable description LI132 | 131<br>characters | Logical<br>input<br>132 | Description of the logical input. This description is used in several menu types for easier identification. |

NOTICE!

After editing user descriptions the event history will start to use the new description only after resetting the HMI. HMI can be reset from *General*  $\rightarrow$  *Device info*  $\rightarrow$  *HMI restart*.

# **Events**

The logical outputs (abbreviated "LOGIC" in event block names) generates events from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp. The function's output signals can be used for direct I/O controlling and user logic programming.

Table. 4.4.9 - 41. Event messages.

| Event block name | Event names        |
|------------------|--------------------|
| LOGIC2           | Logical in 132 ON  |
| LOGIC2           | Logical in 132 OFF |

# 5 Communication

# 5.1 Connections menu

"Connections" menu is found under "Communication" menu. It contains all basic settings of ethernet port and RS-485 serial port included with every AQ-200 device as well as settings of communication option cards.

### Table. 5.1 - 42. Ethernet settings.

| Name   | Range  | Description   |
|--|--|---|
| IP address   | 0.0.0.0255.255.255.255   | Set IP address of the ethernet port in the back of the AQ-200 series device.  |
| Netmask  | 0.0.0.0255.255.255.255   | Set netmask of the ethernet port in the back of the AQ-200 series device.   |
| Gateway  | 0.0.0.0255.255.255.255   | Set gateway of the ethernet port in the back of the AQ-200 series device.   |
| MAC-<br>Address  | 00-00-00-00-00-00FF-<br>FF-FF-FF-FF-FF   | Indication of MAC address of the AQ-200 series device.  |
| Storm<br>Protection                                      | <ul><li>Disable</li><li>Enable</li></ul>   | When enabled, the Storm protection functionality of the internal switch<br>in the device is enabled. This functionality aims to protect the device<br>from excess ethernet traffic caused by storm situation. When enabled,<br>the packet rate allowed to pass through on the ingress port towards<br>the device, is limited to 150 packets per second. Multicast packets<br>are also included in the packet limit. |
| Double<br>Ethernet<br>card mode                          | <ul><li>Switch</li><li>HSR</li><li>PRP</li></ul>   | If the device has a double ethernet option card it is possible to choose its mode.  |
| COM A<br>and<br>Ethernet<br>option<br>card<br>connection | <ul> <li>Block all</li> <li>Allow both directions</li> <li>Allow COM A to option card</li> <li>Allow option card to COM A</li> </ul> | If the device has ethernet option card it is possible to determine the allowed direction of data.   |
| Double<br>Ethernet<br>link events                        | <ul><li>Disable</li><li>Enable</li></ul>   | Disables or enables "Double Ethernet Link A down" and "Double<br>Ethernet Link B down" logic signals and events.  |
| Double<br>Ethernet<br>PRP ports                          | • AB<br>• BA   | LanA and LanB port assigment for communication cards that support PRP.  |

Virtual Ethernet enables the device to be connected to multiple different networks simultaneously via one physical Ethernet connection. Virtual Ethernet has its own separate IP address and network configurations. All Ethernet-based protocol servers listen for client connections on the IP addresses of both the physical Ethernet and the Virtual Ethernet.

### Table. 5.1 - 43. Virtual Ethernet settings.

| Name                              | Description                             |
|-----------------------------------|---|
| Enable virtual adapter (No / Yes) | Enable virtual adapter. Off by default. |
| IP address                        | Set IP address of the virtual adapter.  |
| Netmask                           | Set netmask of the virtual adapter.     |
| Gateway                           | Set gateway of the virtual adapter.     |

AQ-200 series devices are always equipped with an RS-485 serial port. In the software it is identified as "Serial COM1" port.

| Table. 5.1 - | 44. Ser | ial COM1 | settings. |
|--------------|---------|----------|-----------|
|--------------|---------|----------|-----------|

| Name     | Range  | Description                                 |  |
|----------|--|---|--|
| Bitrate  | <ul><li>9600bps</li><li>19200bps</li><li>38400bps</li></ul>  | Bitrate used by RS-485 port.                |  |
| Databits | 78   | Databits used by RS-485 port.               |  |
| Parity   | <ul><li>None</li><li>Even</li><li>Odd</li></ul>  | Paritybits used by RS-485 port.             |  |
| Stopbits | 12   | Stopbits used by RS-485 port.               |  |
| Protocol | <ul> <li>None</li> <li>ModbutRTU</li> <li>ModbusIO</li> <li>IEC103</li> <li>SPA</li> <li>DNP3</li> <li>IEC101</li> </ul> | Communication protocol used by RS-485 port. |  |

AQ-200 series supports communication option card type that has serial fiber ports (Serial COM2) an RS-232 port (Serial COM3).

Table. 5.1 - 45. Serial COM2 settings.

| Name     | Range   | Description                               |  |
|----------|---|---|--|
| Bitrate  | <ul><li>9600bps</li><li>19200bps</li><li>38400bps</li></ul> | Bitrate used by serial fiber channels.    |  |
| Databits | 78  | Databits used by serial fiber channels.   |  |
| Parity   | <ul><li>None</li><li>Even</li><li>Odd</li></ul>             | Paritybits used by serial fiber channels. |  |
| Stopbits | 12  | Stopbits used by serial fiber channels.   |  |

| Name       | Range  | Description   |
|------------|--|---|
| Protocol   | <ul> <li>None</li> <li>ModbutRTU</li> <li>ModbusIO</li> <li>IEC103</li> <li>SPA</li> <li>DNP3</li> <li>IEC101</li> </ul> | Communication protocol used by serial fiber channels. |
| Echo       | <ul><li>Off</li><li>On</li></ul>   | Enable or disable echo.                               |
| Idle Light | <ul><li>Off</li><li>On</li></ul>   | Idle light behaviour.                                 |

Table. 5.1 - 46. Serial COM3 settings.

| Name     | Range  | Description                                 |
|----------|--|---|
| Bitrate  | <ul><li>9600bps</li><li>19200bps</li><li>38400bps</li></ul>  | Bitrate used by RS-232 port.                |
| Databits | 78   | Databits used by RS-232 port.               |
| Parity   | <ul><li>None</li><li>Even</li><li>Odd</li></ul>  | Paritybits used by RS-232 port.             |
| Stopbits | 12   | Stopbits used by RS-232 port.               |
| Protocol | <ul> <li>None</li> <li>ModbutRTU</li> <li>ModbusIO</li> <li>IEC103</li> <li>SPA</li> <li>DNP3</li> <li>IEC101</li> </ul> | Communication protocol used by RS-232 port. |

# 5.2 Time synchronization

Time synchronization source can be selected with "Time synchronization" parameter at *Communication*  $\rightarrow$  *Synchronization*  $\rightarrow$  *General*.

| Table. 5.2 - 47. General time synchronization source setting | 15          |
|--|-------------|
|  | <i>j</i> 0. |

| Name                        | Range  | Description                               |
|-----------------------------|--|---|
| Time synchronization source | <ul> <li>Internal</li> <li>External NTP</li> <li>External serial</li> <li>IRIG-B</li> <li>PTP</li> </ul> | Selection of time synchronization source. |

# 5.2.1 Internal

If no external time synchronization source is available the mode should be set to "internal". This means that the AQ-200 device clock runs completely on its own. Time can be set to the device with AQtivate setting tool with *Commands*  $\rightarrow$  *Sync Time* command or in the clock view from the HMI. When using *Sync time* command AQtivate sets the time to device the connected computer is currently using. Please note that the clock doesn't run when the device is powered off.

# 5.2.2 NTP

When enabled, the NTP (Network Time Protocol) service can use external time sources to synchronize the device's system time. The NTP client service uses an Ethernet connection to connect to the NTP time server. NTP can be enabled by setting the primary time server and the secondary time server parameters to the address of the system's NTP time source(s).

| Table. 5.2.2 - 48. | Server settings. |
|--------------------|------------------|
|--------------------|------------------|

| Name                                | Range                  | Description   |
|-------------------------------------|------------------------|---|
| Primary time<br>server<br>address   | 0.0.0.0255.255.255.255 | Defines the address of the primary NTP server. Setting this parameter at "0.0.0.0" means that the server is not in use.                     |
| Secondary<br>time server<br>address | 0.0.0.0255.255.255.255 | Defines the address of the secondary (or backup) NTP server.<br>Setting this parameter at "0.0.0.0" means that the server is not in<br>use. |
| NTP version                         | 34                     | Defines the NTP version used.   |

Table. 5.2.2 - 49. Status.

| Name                           | Range  | Description   |
|--------------------------------|--|---|
| NTP quality for events         | <ul><li>No sync</li><li>Synchronized</li></ul> | Displays the status of the NTP time synchronization at the moment.<br>NOTE: This indication is not valid if another time synchronization<br>method is used (external serial). |
| NTP-processed<br>message count | 04294967295                                    | Displays the number of messages processed by the NTP protocol.  |

Additionally, the time zone of the device can be set by connecting to the device and the selecting the time zone at *Commands*  $\rightarrow$  *Set time zone* in AQtivate setting tool.

# 5.2.3 PTP

PTP, Precision Time Protocol, is a higher accuracy synchronization protocol for Ethernet networks. Accuracy of microsecond level can be achieved. Time protocol is compliant with IEEE 1588-2008, also known as PTP Version 2 and supports the power profiles as specified in IEEE C37.238-2011, 2017 and IEC61850-9-3 (2016) standards.

In a PTP network the devices can have different roles. There is a Grandmaster clock that is the clock source, normally connected to GPS. Most devices take the role of an Ordinary clock which receive synchronization from the Grandmaster clock. In the PTP network there can also be Boundary and Transparent clock roles, these are most often PTP enabled switches that can redistribute time or compensate for their delays.

BMCA, Best Master Clock Algorithm, is an algorithm that PTP devices use to determine the best clock source. This is utilized in network segments where there are 2 Grandmaster clocks or in situations where there are no Grandmaster available. In these situations the devices make a selection which device will act as the clock source. In these cases without GPS synchronized clock source, the accuracy between the devices is still high.

### Settings

Select PTP as the time synchronization source from Communication  $\rightarrow$  Synchronization  $\rightarrow$  General menu.

The following settings are available in *Communication*  $\rightarrow$  *Synchronization*  $\rightarrow$  *PTP* menu.

Table. 5.2.3 - 50. PTP time synchronization settings.

| Name                           | Range  | Description   |
|--------------------------------|--|---|
| Power<br>profile               | <ul> <li>None</li> <li>IEEE</li> <li>C37-238-2011</li> <li>IEC61850-9-3</li> <li>IEEE</li> <li>C37-238-2017</li> </ul> | Defines used power profile.   |
| Role                           | <ul><li>Auto (Default)</li><li>Master</li><li>Slave</li></ul>  | In Auto mode, the device can take both the role of a clock source and clock consumer. In Master mode the device is forced to concider itself to be a clock source. In Slave mode the device is forced to be a clock consumer. |
| Mechanism                      | <ul><li>P2P (Default)</li><li>E2E</li></ul>  | Delay measurement mechanism used. Peer-to-peer can utilize the PTP<br>enabled switches as transparent ro boundary clocks while End-to-end must<br>be used if non-PTP enabled switches are found in the network.               |
| Domain<br>number               | 0255   | PTP devices can be set to belong to a grouping called domain. Devices in same domain is primearly being synchronized together.  |
| Log<br>announce<br>interval    |  | Mean time interval between successive announce messages.  |
| Log<br>delayReq<br>interval    |  | The minimum permitted mean time interval between successive Delay_Req messages  |
| Log sync<br>interval           |  | Mean time interval between successive sync messages   |
| Sync<br>receipt<br>timeout     |  | Number of sync intervals that must pass without receipt of an sync message before the occurrence of the event SYNC_RECEIPT_TIMEOUT_EXPIRES  |
| Announce<br>receipt<br>timeout |  | Number of announce intervals that must pass without receipt of an<br>announce message before the occurrence of the event<br>ANNOUNCE_RECEIPT_TIMEOUT_EXPIRES  |
| Clock class                    |  | The traceability, synchronization state and expected performance of the time or frequency distributed by the Grandmaster PTP Instance   |
| Clock<br>accuracy              |  | The expected accuracy of a PTP Instance when it is the Grandmaster PTP Instance, or in the event it becomes the Grandmaster PTP Instance  |

| Name               | Range                                      | Description  |  |
|--------------------|--|--|--|
| Priority 1         |  | Priority setting used in the execution of the best master clock algorithm.<br>Lower values take precedence |  |
| Priority 2         |  | Priority setting used in the execution of the best master clock algorithm.<br>Lower values take precedence |  |
| VLAN<br>enable     | <ul><li>Disabled</li><li>Enabled</li></ul> | Enable VLAN header for PTP communication   |  |
| VLAN<br>priority   | 07   | Priority setting for VLAN  |  |
| VLAN ID            | 04095                                      | VLAN identification setting  |  |
| Reconfigure<br>PTP | <ul><li> -</li><li>Reconfigure</li></ul>   | Parameter to trig reconfiguration of the PTP application   |  |

# Status indications

The following status indications are available in *Communication*  $\rightarrow$  *Synchronization*  $\rightarrow$  *PTP* menu.

| Table. | 5.2.3 - | 51. | PTP | status | indications |
|--------|---------|-----|-----|--------|-------------|
| Table. | 0.2.0   | 0   |     | otatao | maioationio |

| Name            | Description   |
|-----------------|---|
| State           | State of the PTP application (Master, Slave, Listening).                            |
| Best master     | Identification of best master in network. Id consist of MAC address plus id number. |
| Last receive    | Time when last synchronization frame was received.                                  |
| Message sent    | Diagnostic message counter.   |
| Message receive | Diagnostic message counter.   |
| PTP timesource  | Diagnostic number describing the current time source.                               |

# 5.3 Communication protocols

# 5.3.1 IEC 61850

The user can enable the IEC 61850 protocol in device models that support this protocol at *Communication*  $\rightarrow$  *Protocols*  $\rightarrow$  *IEC61850*. AQ-21x frame units support Edition 1 of IEC 61850. AQ-25x frame units support both Edition 1 and 2 of IEC 61850. The following services are supported by IEC 61850 in Arcteq devices:

- Up to six data sets (predefined data sets can be edited with the IEC 61850 tool in AQtivate)
- Report Control Blocks (both buffered and unbuffered reporting)
- Control ('Direct operate with normal security', 'Select before operate with normal security, 'Direct with enhanced security' and 'Select before operate with enhanced sequrity' control sequences)
- Disturbance recording file transfer
- GOOSE
- Time synchronization

The device's current IEC 61850 setup can be viewed and edited with the IEC61850 tool (*Tools*  $\rightarrow$  *Communication*  $\rightarrow$  *IEC* 61850).

### **Settings**

The general setting parameters for the IEC 61850 protocol are visible both in AQtivate and in the local HMI. The settings are described in the table below.

Table. 5.3.1 - 52. General settings.

| Name   | Range   | Step        | Default           | Description   |
|--|---|-------------|-------------------|---|
| Enable IEC 61850                                       | <ul><li>Disabled</li><li>Enabled</li></ul>                                    | -           | Disabled          | Enables and disables the IEC 61850 communication protocol.  |
| Reconfigure IEC 61850                                  | <ul><li> -</li><li>Reconfigure</li></ul>                                      | -           | -                 | Reconfigures IEC 61850 settings.  |
| IP port  | 065 535   | 1           | 102               | Defines the IP port used by the IEC 61850<br>protocol.<br>The standard (and default) port is 102.   |
| IEC61850 edition                                       | • Ed1<br>• Ed2  | -           | -                 | Displays the IEC61850 edition used by the device. Edition can be chosen by loading a new CID file at <i>Tools</i> $\rightarrow$ <i>Communication</i> $\rightarrow$ <i>IEC 61850</i> with <i>Open</i> button.  |
| Control Authority switch                               | <ul> <li>Remote<br/>Control</li> <li>Station<br/>Level<br/>Control</li> </ul> | -           | Remote<br>Control | The device can be set to allow object control via<br>IEC 61850 only from clients that are of category<br>Station level control. This would mean that other<br>Remote control clients would not be allowed to<br>control. In Remote control mode all IEC 61850<br>clients of both remote and station level category<br>are allowed to control objects. |
| Ethernet port  | <ul> <li>All</li> <li>COM A</li> <li>Double<br/>ethernet<br/>card</li> </ul>  | -           | All               | Determines which ports use IEC61850.<br>Parameter is visible if double ethernet option<br>card is found in the device.  |
| Configure GOOSE<br>Subscriber from CID file<br>allowed | <ul><li>Disabled</li><li>Allowed</li></ul>                                    | _           | Disabled          | In edition 2 of IEC 61850 GOOSE subscriber configuration is a part of the CID file. Determines if it is possible to import published GOOSE settings of another device with a CID file and set them to GOOSE input at <i>Tools</i> $\rightarrow$ <i>Communication</i> $\rightarrow$ <i>IEC</i> 61850 $\rightarrow$ GOOSE subscriptions.                |
| General deadband                                       | 0.110.0 %   | 0.1<br>%    | 2 %               | Determines the general data reporting deadband settings.  |
| Active energy deadband                                 | 0.11000.0<br>kWh  | 0.1<br>kWh  | 2 kWh             | Determines the data reporting deadband settings for this measurement.   |
| Reactive<br>energy deadband                            | 0.11000.0<br>kVar   | 0.1<br>kVar | 2 kVar            | Determines the data reporting deadband settings for this measurement.   |
| Active power deadband                                  | 0.11000.0<br>kW   | 0.1<br>kW   | 2 kW              | Determines the data reporting deadband settings for this measurement.   |

| Name                          | Range  | Step        | Default | Description   |
|-------------------------------|--|-------------|---------|---|
| Reactive power deadband       | 0.11000.0<br>kVar  | 0.1<br>kVar | 2 kVar  | Determines the data reporting deadband settings for this measurement.   |
| Apparent power deadband       | 0.11000.0<br>kVA   | 0.1<br>kVA  | 2 kVA   | Determines the data reporting deadband settings for this measurement.   |
| Power factor deadband         | 0.010.99   | 0.01        | 0.05    | Determines the data reporting deadband settings for this measurement.   |
| Frequency deadband            | 0.011.00 Hz  | 0.01<br>Hz  | 0.1 Hz  | Determines the data reporting deadband settings for this measurement.   |
| Current deadband              | 0.0150.00 A  | 0.01<br>A   | 5 A     | Determines the data reporting deadband settings for this measurement.   |
| Residual current deadband     | 0.0150.00 A  | 0.01<br>A   | 0.2 A   | Determines the data reporting deadband settings for this measurement.   |
| Voltage deadband              | 0.015000.00<br>V   | 0.01<br>V   | 200 V   | Determines the data reporting deadband settings for this measurement.   |
| Residual voltage deadband     | 0.015000.00<br>V   | 0.01<br>V   | 200 V   | Determines the data reporting deadband settings for this measurement.   |
| Angle<br>measurement deadband | 0.15.0 deg   | 0.1<br>deg  | 1 deg   | Determines the data reporting deadband settings for this measurement.   |
| Integration time              | 010 000 ms   | 1<br>ms     | 0 ms    | Determines the integration time of the protocol. If<br>this parameter is set to "0 ms", no integration<br>time is in use. |
| GOOSE Ethernet port           | <ul> <li>All</li> <li>COM A</li> <li>Double<br/>ethernet<br/>card</li> </ul> | -           | All     | Determines which ports can use GOOSE<br>communication. Visible if double ethernet option<br>card is found in the device.  |

For more information on the IEC 61850 communication protocol support, please refer to the conformance statement documents (<u>www.arcteq.fi/downloads/</u>  $\rightarrow$  AQ 200 series  $\rightarrow$  Resources).

# 5.3.1.1 Logical device mode and logical node mode

Every protection block has its own behavior (LNBeh). This behavior is determined using a combination of the protection block's mode (LNMod) and the device's mode (LDMod).

In IEC68150 mode,

- LNMod can be reported and controlled through Mod data object in all logical nodes.
- LNBeh can be reported through Beh data object in all logical nodes.
- LDMod is only visible through logical node zero's Mod data object (LLN0.Mod).

### Mode and behavior values

There are 5 values defined for mode and behavior: On, Blocked, Test, Test / Blocked and Off.

#### Table. 5.3.1.1 - 53. Behavior descriptions.

| LNBeh                 | On               | Blocked          | Test          | Test / Blocked | Off                  |
|-----------------------|------------------|------------------|---------------|----------------|----------------------|
| Function working      | Yes              | Yes              | Yes           | Yes            | No                   |
| Data quality          | Relevant to data | Relevant to data | q.test = True | q.test = True  | q.validity = Invalid |
| Output to process     | Yes              | No               | Yes           | No             | No                   |
| Accept normal control | Yes              | Yes              | No            | No             | No                   |
| Accept test control   | No               | No               | Yes           | Yes            | No                   |

The communication services for the data object Mod do not care about the status of the LNBeh. Mod will always accept commands with q.test = False.

Data objects Mod, Beh and Health will always have q.validity = Good. Regardless of the status of LNBeh, the quality test attribute of Mod, Beh and Health shall be q.test = False.

### **Behavior determination**

The values for LDMod and LNMod are settable by the user by using HMI, setting tool, or IEC 61850 client. The value for LNBeh are then determined using following rules.

- If either LDMod or LNMod is Off, LNBeh is Off.
- Otherwise,
  - If either LDMod or LNMod is set to either "Test" or "Test / Blocked" mode, LNBeh is in Test mode.
  - If either LDMod or LNMod is set to either "Blocked" or "Test / Blocked" mode, LNBeh is in Blocked mode.
  - If LNBeh still doesn't have anything, LNBeh is "On".

All the possible combinations are laid out in the following table.

| LDMod          | LNMod          | LNBeh          |
|----------------|----------------|----------------|
|                | Off            | Off            |
|                | Test / Blocked | Off            |
| Off            | Test           | Off            |
|                | Blocked        | Off            |
|                | On             | Off            |
|                | Off            | Off            |
| Test / Blocked | Test / Blocked | Test / Blocked |
|                | Test           | Test / Blocked |
|                | Blocked        | Test / Blocked |
|                | On             | Test / Blocked |

5 Communication

Version: 2.12

| LDMod   | LNMod          | LNBeh          |
|---------|----------------|----------------|
|         | Off            | Off            |
|         | Test / Blocked | Test / Blocked |
| Test    | Test           | Test           |
|         | Blocked        | Test / Blocked |
|         | On             | Test           |
|         | Off            | Off            |
|         | Test / Blocked | Test / Blocked |
| Blocked | Test           | Test / Blocked |
|         | Blocked        | Blocked        |
|         | On             | Blocked        |
|         | Off            | Off            |
|         | Test / Blocked | Test / Blocked |
| On      | Test           | Test           |
|         | Blocked        | Blocked        |
|         | On             | On             |

# Processing of incoming data in different behaviors

This part only applies to incoming data with quality information.

The table below gives the functional processing of the data in different behavior states **as defined by the standard**. Logical nodes should process receiving data according to their quality information:

- Processed as valid Reacts according to the quality.
- Processed as invalid Reacts as if the quality of the data had been invalid.
- Processed as questionable The application decides how to consider the status value.
- Not processed Do not belong to communication services, no quality bit can be evaluated.

Table. 5.3.1.1 - 55. Processing of incoming data in different behaviors as defined by the standard.

|  | On                        | Blocked                   | Test                      | Test / Blocked            | Off              |
|--|---------------------------|---------------------------|---------------------------|---------------------------|------------------|
| q.validity = Good<br>q.test = False            | Processed as valid        | Processed as valid        | Processed as valid        | Processed as valid        | Not<br>processed |
| q.validity =<br>Questionable<br>q.test = False | Processed as questionable | Processed as questionable | Processed as questionable | Processed as questionable | Not<br>processed |
| q.validity = Good<br>q.test = True             | Processed as invalid      | Processed as invalid      | Processed as valid        | Processed as valid        | Not<br>processed |

|  | On                   | Blocked                 | Test                      | Test / Blocked            | Off              |
|--|----------------------|-------------------------|---------------------------|---------------------------|------------------|
| q.validity =<br>Questionable<br>q.test = True      | Processed as invalid | Processed as invalid    | Processed as questionable | Processed as questionable | Not<br>processed |
| q.validity =<br>Invalid<br>q.test = True/<br>False | Processed as invalid | Processed as<br>invalid | Processed as<br>invalid   | Processed as<br>invalid   | Not<br>processed |

Arcteq's implementation treats "Processed as questionable" and "Processed as invalid" in the same way with "Not processed". Only "Processed as valid" is passed to the application.

Table. 5.3.1.1 - 56. Arcteq's implementation of processing of incoming data in different behaviors.

|  | On                 | Blocked            | Test               | Test / Blocked     | Off |
|--|--------------------|--------------------|--------------------|--------------------|-----|
| q.validity = Good<br>q.test = False            | Processed as valid | Processed as valid | Processed as valid | Processed as valid |     |
| q.validity =<br>Questionable<br>q.test = False |                    |                    |                    |                    |     |
| q.validity = Good<br>q.test = True             |                    |                    | Processed as valid | Processed as valid |     |
| q.validity =<br>Questionable<br>q.test = True  |                    |                    |                    |                    |     |
| q.validity = Invalid<br>q.test = True/False    |                    |                    |                    |                    |     |

### Using mode and behavior

Enabling LDMod and LNMod changing can be done at General  $\rightarrow$  Device info.

Table. 5.3.1.1 - 57. Parameters to allow changing of LNMod and LDMod.

| Name                         | Range  | Default    | Description   |
|------------------------------|--|------------|---|
| Allow setting of device mode | <ul> <li>Prohibited</li> <li>From HMI/<br/>setting tool only</li> <li>Allowed</li> </ul> | Prohibited | Allows global mode to be modified from setting tool,<br>HMI and IEC61850.<br>Prohibited: Cannot be changed.<br>From HMI/setting tool only: Can only be changed<br>from the setting tool or HMI.<br>Allowed: Can be changed from the setting tool,<br>HMI, and IEC 61850 client. |

| Name                                   | Range  | Default    | Description  |
|--|--|------------|--|
| Allow setting of<br>individual LN mode | <ul> <li>Prohibited</li> <li>From HMI/<br/>setting tool only</li> <li>Allowed</li> </ul> | Prohibited | Allow local modes to be modified from setting tool,<br>HMI and IEC61850.<br>This parameter is visible only when "Allow setting of<br>device mode" is enabled.<br>Prohibited: Cannot be changed.<br>From HMI/setting tool only: Can only be changed<br>from the setting tool or HMI<br>Allowed: Can be changed from the setting tool,<br>HMI, and IEC 61850 client. |

When enabled it is possible to change LDMod at Communication  $\rightarrow$  Protocols  $\rightarrow$  IEC61850.

Table. 5.3.1.1 - 58. Parameter for changing logical device mode.

| Name                         | Range   | Default | Description   |
|------------------------------|---|---------|---|
| Allow setting of device mode | <ul> <li>On</li> <li>Blocked</li> <li>Test</li> <li>Test/<br/>Blocked</li> <li>Off</li> </ul> | On      | Set mode of logical device.<br>This parameter is visible only when <i>Allow setting of device</i><br><i>mode</i> is enabled in <i>General</i> menu. |

Each protection, control and monitoring function has its own logical node mode which can be changed individually. This parameter is found in the functions *Info*-menu. Each function also reports its behavior. Behavior of the function is influenced by the status of the device mode setting and the functions mode setting.

Table. 5.3.1.1 - 59. LNMod parameters.

| Name           | Range   | Default |   |
|----------------|---|---------|---|
| LN<br>mode     | <ul> <li>On</li> <li>Blocked</li> <li>Test</li> <li>Test/<br/>Blocked</li> <li>Off</li> </ul> | On      | Set mode of function logical node.<br>This parameter is visible only when <i>Allow setting of individual LN mode</i> is<br>enabled in <i>General</i> menu.              |
| LN<br>behavior | <ul> <li>On</li> <li>Blocked</li> <li>Test</li> <li>Test/<br/>Blocked</li> <li>Off</li> </ul> | On      | Displays the mode of the function logical node.<br>This parameter is visible only when <i>Allow setting of individual LN mode</i> is<br>enabled in <i>General</i> menu. |

# 5.3.1.2 GOOSE

Arcteq devices support both GOOSE publisher and GOOSE subscriber. GOOSE subscriber is enabled with the "GOOSE subscriber enable" parameter at *Communication*  $\rightarrow$  *Protocols*  $\rightarrow$  *IEC 61850/GOOSE*. The GOOSE inputs are configured using either the local HMI or the AQtivate software.

There are up to 64 GOOSE inputs available for use. Each of the GOOSE inputs also has a corresponding input quality signal which can also be used in internal logic. The quality is good, when the input quality status is "low" (that is, when the quality is marked as "0"). The value of the input quality can switch on as a result of a GOOSE time-out or a configuration error, for example. The status and quality of the various logical input signals can be viewed at the GOOSE IN status and GOOSE IN quality tabs at Control  $\rightarrow$  Device I/O  $\rightarrow$  Logical signals.

# General GOOSE setting

The table below presents general settings for GOOSE publisher.

| Table. 5.3.1.2 - 60. General GOOSE publisher setti | ngs. |
|--|------|
|--|------|

| Name                                    | Range                                 | Description  |
|---|---------------------------------------|--|
| GOOSE control block<br>1 simulation bit | Disabled     Default                  | The publisher will publish frames with simulation bit active if enabled. |
| GOOSE control block<br>2 simulation bit | (Default) <ul> <li>Enabled</li> </ul> | For GOOSE simulation testing purposes.                                   |

The table below presents general settings for GOOSE subscriber

Table. 5.3.1.2 - 61. General GOOSE subscriber settings.

| Name  | Range   | Description  |
|---|---|--|
| GOOSE<br>subscriber<br>enable                   | <ul><li>Disabled<br/>(Default)</li><li>Enabled</li></ul>                      | Enables or disables GOOSE subscribing for the device.  |
| Not used<br>GOOSE input<br>Quality              | <ul> <li>Bad<br/>quality<br/>(1)</li> <li>Good<br/>quality<br/>(0)</li> </ul> | Defines what state should GOOSE input quality signal to be in the logic if the input has been set as "disabled".   |
| Subscriber<br>checks<br>GoCBRef                 | • No  | When subscriber sees GOOSE frame it checks APPID and Conf. Rev but can   |
| Subscriber<br>checks<br>SqNum                   | (Default)<br>• Yes  | also check if GoCBRef or SqNum match.  |
| Subscriber<br>process<br>simulation<br>messages | <ul> <li>No<br/>(Default)</li> <li>Yes</li> </ul>                             | Subscriber can be set to process frames which are published with simulation bit<br>high if enabled.<br>The subscriber can still subscribe to non-simulated frames from a publisher until<br>that a simulated frame is received from a publisher. From that point on, only<br>simulated frames are accepted from that publisher.<br>For other publishers, non-simulated frames are accepted normally (given no<br>simulated frame is received from that publisher).<br>This behavior ends when the setting is set back to No. |

# GOOSE input settings

The table below presents the different settings available for all 64 GOOSE inputs.

These settings can be found from Communication  $\rightarrow$  Protocols  $\rightarrow$  IEC61850/GOOSE  $\rightarrow$  GOOSE Input Settings.

| Name                                     | Range  | Description  |
|--|--|--|
| In use                                   | <ul><li>No<br/>(Default)</li><li>Yes</li></ul>   | Enables and disables the GOOSE input in question.  |
| Application<br>ID<br>("AppID")           | 0×00×3FFF  | Defines the application ID that will be matched with the publisher's GOOSE control block.  |
| Configuration<br>revision<br>("ConfRev") | 12 <sup>32</sup> -1  | Defines the configuration revision that will be matched with the publisher's GOOSE control block.  |
| Data index<br>("Dataldx")                | 099  | Defines the data index of the value in the matched published frame. It is the status of the GOOSE input.   |
| Nextldx is<br>quality                    | <ul><li>No<br/>(Default)</li><li>Yes</li></ul>   | Selects whether or not the next received input is the quality bit of the GOOSE input.  |
| Data type                                | <ul> <li>Boolean<br/>(Default)</li> <li>Integer</li> <li>Unsigned</li> <li>Floating<br/>point</li> </ul> | Selects the data type of the GOOSE input.  |
| Control block<br>reference               | -  | GOOSE subscriber can be set to check the GCB reference of the published<br>GOOSE frame. This setting is automatically filled when Ed2 GOOSE<br>configuration is done by importing cid file of the publisher. |

# **GOOSE** input descriptions

Each of the GOOSE inputs can be given a description. The user defined description are displayed in most of the menus:

- logic editor
- matrix
- block settings
- event history
- disturbance recordings
- etc.

These settings can be found from Control  $\rightarrow$  Device IO  $\rightarrow$  Logical Signals  $\rightarrow$  GOOSE IN Description.

Table. 5.3.1.2 - 63. GOOSE input user description.

| Name                              | Range             | Default | Description   |
|-----------------------------------|-------------------|---------|---|
| User editable<br>description GI x | 131<br>characters |         | Description of the GOOSE input. This description is used in several menu types for easier identification. |

# GOOSE input values

Each of the GOOSE subscriber inputs (1...64) have indications listed in the following table. These indications can be found from *Communication*  $\rightarrow$  *Protocols*  $\rightarrow$  *IEC61850/GOOSE*  $\rightarrow$  *GOOSE input values.* 

| Table. | 5.3.1. | 2 - 64. | GOOSE | input | indications |
|--------|--------|---------|-------|-------|-------------|
| rabio. | 0.0.1. | 2 0 1.  | COOL  | nipat | maioationio |

| Name                             | Range   | Description   |
|----------------------------------|---|---|
| Subscription status              | <ul><li>Not Active</li><li>Active</li></ul>   | When active correct data received and passed to application.  |
| Processing<br>simulation message | <ul><li>False</li><li>True</li></ul>  | When true subscriber is processing simulation frames for this input (and rejecting non-simulated frames). |
| Needs<br>commissioning           | <ul><li>False</li><li>True</li></ul>  | When true configuration doesn't match the received frame (goCBRef, confRev).                              |
| Last received state number       | 04294967295   | Status number (stNum) of the last data passed to application.   |
| GOOSE IN X<br>boolean value      | 01  | GOOSE input 164 boolean value.  |
| GOOSE IN X<br>analog value       | -3.4E+383.4E+38   | GOOSE input 164 analog value.   |
| GOOSE IN X<br>quality            | <ul> <li>Old data</li> <li>Failure</li> <li>Oscillatory</li> <li>Bad reference</li> <li>Out of range</li> <li>Overflow</li> <li>Invalid</li> <li>Reserved/<br/>Questionable</li> <li>Operator<br/>blocked</li> <li>Test</li> <li>Substituted</li> <li>Inaccurate</li> <li>Inconsistent</li> </ul> | GOOSE input quality indication.   |
| GOOSE IN X time                  | DD/MM/YYYY<br>HH:MM:SS  | Time when publisher sent GOOSE frame.   |
| GOOSE IN X time fraction         | 04294967295 µs  | Microseconds of the publisher GOOSE frame.  |

# **GOOSE** events

GOOSE signals generate events from status changes. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp and with process data values. The time stamp resolution is 1 ms.

#### Table. 5.3.1.2 - 65. GOOSE event

| Event block name | Event name   | Description   |
|------------------|--|---|
| GOOSE1GOOSE2     | GOOSE IN 164 ON/OFF  | Status change of GOOSE input.   |
| GOOSE3GOOSE4     | GOOSE IN 164 quality Bad/<br>Good                            | Status change of GOOSE inputs quality.  |
| GOOSE5GOOSE6     | GOOSE Subscription status<br>164 Active/Not active           | When active correct data received and passed to application.  |
| GOOSE7GOOSE8     | GOOSE Processing simulated messages 164 True/False           | When true subscriber is processing simulation frames for this input (and rejecting non-simulated frames). |
| GOOSE9GOOSE10    | GOOSE Subscription needs<br>commissioning 164 True/<br>False | When true configuration doesn't match the received frame (goCBRef, confRev).                              |

### Setting the publisher

The configuration of the GOOSE publisher is done using the IEC 61850 tool in AQtivate (*Tools*  $\rightarrow$  *Communication*  $\rightarrow$  *IEC* 61850). Refer to *AQtivate-200 Instruction manual* for more information on how to set up GOOSE publisher.

# 5.3.2 Modbus/TCP and Modbus/RTU

The device supports both Modbus/TCP and Modbus/RTU communication. Modbus/TCP uses the Ethernet connection to communicate with Modbus/TCP clients. Modbus/RTU is a serial protocol that can be selected for the available serial ports.

The following Modbus function types are supported:

- Read multiple holding registers (function code 3)
- Write single holding register (function code 6)
- Write multiple holding registers (function code 16)
- Read/Write multiple registers (function code 23)

The following data can be accessed using both Modbus/TCP and Modbus/RTU:

- Device measurements
- Device I/O
- Commands
- Events
- Time

Once the configuration file has been loaded, the user can access the Modbus map of the device via the AQtivate software (*Tools*  $\rightarrow$  *Communication*  $\rightarrow$  *Modbus Map*). Please note that holding registers start from 1. Some masters might begin numbering holding register from 0 instead of 1; this will cause an offset of 1 between the device and the master. Modbus map can be edited with Modbus Configurator (*Tools*  $\rightarrow$  *Communication*  $\rightarrow$  *Modbus Configurator*).

#### Table. 5.3.2 - 66. Modbus/TCP settings.

| Parameter                | Range   | Description  |
|--------------------------|---|--|
| Enable<br>Modbus/<br>TCP | <ul><li>Disabled</li><li>Enabled</li></ul>  | Enables and disables the Modbus/TCP on the Ethernet port.  |
| IP port                  | 065 535   | Defines the IP port used by Modbus/TCP. The standard port (and the default setting) is 502.  |
| Ethernet<br>port         | <ul> <li>All</li> <li>COM A</li> <li>Double<br/>Ethernet card</li> </ul>  | Defines which ethernet ports are available for Modbus connection. Visible if any double ethernet option card is installed in the device.             |
| Event read<br>mode       | <ul> <li>Get oldest<br/>available</li> <li>Continue<br/>previous<br/>connection</li> <li>New events<br/>only</li> </ul> | Get oldest event possible (Default)<br>Continue with the event idx from previous connection<br>Get only new events from connection time and forward. |

#### Table. 5.3.2 - 67. Modbus/RTU settings.

| Parameter          | Range | Description  |
|--------------------|-------|--|
| Slave address 1247 |       | Defines the Modbus/RTU slave address for the unit. |

### **Reading events**

Modbus protocol does not support time-stamped events by standard definition. This means that every vendor must come up with their own definition how to transfer events from the device to the client. In AQ-200 series devices events can be read from HR17...HR22 holding registers. HR17 contains the event-code, HR18...20 contains the time-stamp in UTC, HR21 contains a sequential index and HR22 is reserved for future expansion. See the Modbus Map for more information. The event-codes and their meaning can be found from Event list (*Tools*  $\rightarrow$  *Events ang Logs*  $\rightarrow$  *Event list* in setting tool). The event-code in HR17 is 0 if no new events can be found in the device event-buffer. Every time HR17 is read from client the event in event-buffer is consumed and on following read operation the next un-read event information can be found from event registers. HR11...HR16 registers contains a back-up of last read event. This is because some users want to double-check that no events were lost

# 5.3.3 IEC 103

IEC 103 is the shortened form of the international standard IEC 60870-5-103. The AQ-200 series units are able to run as a secondary (slave) station. The IEC 103 protocol can be selected for the serial ports that are available in the device. A primary (master) station can then communicate with the AQ-200 device and receive information by polling from the slave device. The transfer of disturbance recordings is not supported.

**NOTE**: Once the configuration file has been loaded, the IEC 103 map of the device can be found in the AQtivate software (*Tools*  $\rightarrow$  *IEC* 103 map).

The following table presents the setting parameters for the IEC 103 protocol.

| Name                            | Range | Step | Default | Description                                       |
|---------------------------------|-------|------|---------|---|
| Slave address                   | 1254  |      | 1       | Defines the IEC 103 slave address for the unit.   |
| Measurement interval 060 000 ms |       | 1 ms | 2000 ms | Defines the interval for the measurements update. |

# 5.3.4 IEC 101/104

The standards IEC 60870-5-101 and IEC 60870-5-104 are closely related. Both are derived from the IEC 60870-5 standard. On the physical layer the IEC 101 protocol uses serial communication whereas the IEC 104 protocol uses Ethernet communication. The IEC 101/104 implementation works as a slave in the unbalanced mode.

For detailed information please refer to the IEC 101/104 interoperability document (<u>www.arcteq.fi/</u> <u>downloads/</u>  $\rightarrow$  AQ-200 series  $\rightarrow$  Resources  $\rightarrow$  "AQ-200 IEC101 & IEC104 interoperability").

# IEC 101 settings

Table. 5.3.4 - 68. IEC 101 settings.

| Name                                  | Range   | Step | Default | Description  |
|---------------------------------------|---------|------|---------|--|
| Common<br>address of<br>ASDU          | 065 534 | 1    | 1       | Defines the common address of the application service data unit (ASDU) for the IEC 101 communication protocol. |
| Common<br>address of<br>ASDU size     | 12      | 1    | 2       | Defines the size of the common address of ASDU.  |
| Link layer<br>address                 | 065 534 | 1    | 1       | Defines the address for the link layer.  |
| Link layer<br>address size            | 12      | 1    | 2       | Defines the address size of the link layer.  |
| Information<br>object address<br>size | 23      | 1    | 3       | Defines the address size of the information object.  |
| Cause of<br>transmission<br>size      | 12      | 1    | 2       | Defines the cause of transmission size.  |

# IEC 104 settings

Table. 5.3.4 - 69. IEC 104 settings.

| Name              | Range                                      | Step | Default  | Description  |
|-------------------|--|------|----------|--|
| IEC 104<br>enable | <ul><li>Disabled</li><li>Enabled</li></ul> | -    | Disabled | Enables and disables the IEC 104 communication protocol. |
| IP port           | 065 535                                    | 1    | 2404     | Defines the IP port used by the protocol.                |

| Name                         | Range  | Step | Default | Description   |  |
|------------------------------|--|------|---------|---|--|
| Ethernet<br>port             | <ul> <li>All</li> <li>COM A</li> <li>Double<br/>Ethernet<br/>card</li> </ul> | -    | All     | Defines which ethernet ports are available for Modbus connectior<br>Visible if any double ethernet option card is installed in the device.  |  |
| Common<br>address<br>of ASDU | 065 534  | 1    | 1       | Defines the common address of the application service data unit (ASDU) for the IEC 104 communication protocol.  |  |
| APDU<br>timeout<br>(t1)      | 03600 s  | 1 s  | 0 s     | The maximum amount of time the slave waits for a transmitted<br>Application Protocol Data Unit (APDU) to be confirmed as received<br>by the master.   |  |
| Idle<br>timeout<br>(t3)      | 03600 s  | 1 s  | 0 s     | The slave outstation can use a test fram to determine if the channels is still available after a prolonged period of communications inactivity. Test frame is sent at an interval specified here. |  |

## Measurement scaling coefficients

The measurement scaling coefficients are available for the following measurements, in addition to the general measurement scaling coefficient:

Table. 5.3.4 - 70. Measurements with scaling coefficient settings.

| Name             | Range  |
|------------------|--|
| Active energy    |  |
| Reactive energy  |  |
| Active power     |  |
| Reactive power   | <ul> <li>No scaling</li> <li>1/10</li> </ul>                         |
| Apparent power   | <ul> <li>1/100</li> <li>1/1000</li> <li>1/10 000</li> </ul>          |
| Power factor     | <ul> <li>1/10 000</li> <li>1/100 000</li> <li>1/1 000 000</li> </ul> |
| Frequency        | • 10<br>• 10   |
| Current          | • 1000<br>• 10 000   |
| Residual current | <ul> <li>100 000</li> <li>1 000 000</li> </ul>                       |
| Voltage          |  |
| Residual voltage |  |
| Angle            |  |

## Deadband settings.

| Table 531-71        | Analog change | deadband settings  |
|---------------------|---------------|--------------------|
| Table: 5.5.4 - 7 1. | Analog change | deadband settings. |

| Name                          | Range         | Step    | Default | Description   |
|-------------------------------|---------------|---------|---------|---|
| General deadband              | 0.110.0%      | 0.1%    | 2%      | Determines the general data reporting deadband settings.  |
| Active energy deadband        | 0.11000.0kWh  | 0.1kWh  | 2kWh    |   |
| Reactive<br>energy deadband   | 0.11000.0kVar | 0.1kVar | 2kVar   |   |
| Active power deadband         | 0.11000.0kW   | 0.1kW   | 2kW     |   |
| Reactive power deadband       | 0.11000.0kVar | 0.1kVar | 2kVar   |   |
| Apparent<br>power deadband    | 0.11000.0kVA  | 0.1kVA  | 2kVA    |   |
| Power factor deadband         | 0.010.99      | 0.01    | 0.05    | Determines the data reporting deadband  |
| Frequency deadband            | 0.011.00Hz    | 0.01Hz  | 0.1Hz   | settings for this measurement.  |
| Current deadband              | 0.0150.00A    | 0.01A   | 5A      |   |
| Residual current deadband     | 0.0150.00A    | 0.01A   | 0.2A    |   |
| Voltage deadband              | 0.015000.00V  | 0.01V   | 200V    |   |
| Residual<br>voltage deadband  | 0.015000.00V  | 0.01V   | 200V    |   |
| Angle<br>measurement deadband | 0.15.0deg     | 0.1deg  | 1deg    |   |
| Integration time              | 010 000ms     | 1ms     | -       | Determines the integration time of the protocol. If this parameter is set to "0 ms", no integration time is in use. |

## 5.3.5 SPA

The device can act as a SPA slave. SPA can be selected as the communication protocol for the RS-485 port (Serial COM1). When the device has a serial option card, the SPA protocol can also be selected as the communication protocol for the serial fiber (Serial COM2) ports or RS-232 (Serial COM3) port. Please refer to the chapter "<u>Construction and installation</u>" in the device manual to see the connections for these modules.

The data transfer rate of SPA is 9600 bps, but it can also be set to 19 200 bps or 38 400 bps. As a slave the device sends data on demand or by sequenced polling. The available data can be measurements, circuit breaker states, function starts, function trips, etc. The full SPA signal map can be found in AQtivate (*Tools*  $\rightarrow$  *SPA map*).

The SPA event addresses can be found at  $Tools \rightarrow Events$  and  $logs \rightarrow Event$  list.

#### Table. 5.3.5 - 72. SPA setting parameters.

| Name                | Range                                      | Description  |
|---------------------|--|--|
| SPA<br>address      | 1899                                       | SPA slave address.   |
| UTC<br>time<br>sync | <ul><li>Disabled</li><li>Enabled</li></ul> | Determines if UTC time is used when synchronizing time. When disabled it is assumed time synchronization uses local time. If enabled it is assumed that UTC time is used. When UTC time is used the timezone must be set at <i>Commands</i> $\rightarrow$ <i>Set time zone</i> . |

# NOTICE!

To access SPA map and event list, an .aqs configuration file should be downloaded from the device.

## 5.3.6 DNP3

DNP3 is a protocol standard which is controlled by the DNP Users Group (www.dnp.org). The implementation of a DNP3 slave is compliant with the DNP3 subset (level) 2, but it also contains some functionalities of the higher levels. For detailed information please refer to the DNP3 Device Profile document (www.arcteq.fi/downloads/  $\rightarrow$  AQ-200 series  $\rightarrow$  Resources).

### **Settings**

The following table describes the DNP3 setting parameters.

| Name                             | Range  | Step | Default  | Description   |  |
|----------------------------------|--|------|----------|---|--|
| Enable<br>DNP3 TCP               | <ul><li>Disabled</li><li>Enabled</li></ul>                                   | -    | Disabled | Enables and disables the DNP3 TCP communication protocol<br>when the Ethernet port is used for DNP3. If a serial port is used,<br>the DNP3 protocol can be enabled from <i>Communication</i> $\rightarrow$<br><i>DNP3</i> . |  |
| IP port                          | 065 535  | 1    | 20 000   | Defines the IP port used by the protocol.   |  |
| Ethernet<br>port                 | <ul> <li>All</li> <li>COM A</li> <li>Double<br/>Ethernet<br/>card</li> </ul> | -    | All      | Defines which ethernet ports are available for Modbus connection. Visible if any double ethernet option card is installed in the device.  |  |
| Slave<br>address                 | 165 519  | 1    | 1        | Defines the DNP3 slave address of the unit.   |  |
| Master<br>address                | 165 534  | 1    | 2        | Defines the address for the allowed master.   |  |
| Link layer<br>time-out           | 060<br>000ms   | 1ms  | Oms      | Defines the length of the time-out for the link layer.  |  |
| Link layer<br>retries            | 120  | 1    | 1        | Defines the number of retries for the link layer.   |  |
| Diagnostic<br>- Error<br>counter | 02 <sup>32</sup> -1  | 1    | -        | Counts the total number of errors in received and sent messages.  |  |

| Name                                       | Range               | Step | Default | Description                                      |
|--|---------------------|------|---------|--|
| Diagnostic<br>-<br>Transmitted<br>messages | 02 <sup>32</sup> -1 | 1    | -       | Counts the total number of transmitted messages. |
| Diagnostic<br>- Received<br>messages       | 02 <sup>32</sup> -1 | 1    | -       | Counts the total number of received messages.    |

## **Default variations**

Table. 5.3.6 - 74. Default variations.

| Name                             | Range  | Default | Description   |
|----------------------------------|--|---------|---|
| Group 1 variation (BI)           | <ul><li>Var 1</li><li>Var 2</li></ul>  | Var 1   | Selects the variation of the binary signal.         |
| Group 2 variation (BI change)    | <ul><li>Var 1</li><li>Var 2</li></ul>  | Var 2   | Selects the variation of the binary signal change.  |
| Group 3 variation (DBI)          | <ul><li>Var 1</li><li>Var 2</li></ul>  | Var 1   | Selects the variation of the double point signal.   |
| Group 4 variation (DBI change)   | <ul><li>Var 1</li><li>Var 2</li></ul>  | Var 2   | Selects the variation of the double point signal.   |
| Group 20 variation (CNTR)        | <ul> <li>Var 1</li> <li>Var 2</li> <li>Var 5</li> <li>Var 6</li> </ul>                               | Var 1   | Selects the variation of the control signal.        |
| Group 22 variation (CNTR change) | <ul> <li>Var 1</li> <li>Var 2</li> <li>Var 5</li> <li>Var 6</li> </ul>                               | Var 5   | Selects the variation of the control signal change. |
| Group 30 variation (AI)          | <ul> <li>Var 1</li> <li>Var 2</li> <li>Var 3</li> <li>Var 4</li> <li>Var 5</li> </ul>                | Var 5   | Selects the variation of the analog signal.         |
| Group 32 variation (Al change)   | <ul> <li>Var 1</li> <li>Var 2</li> <li>Var 3</li> <li>Var 4</li> <li>Var 5</li> <li>Var 7</li> </ul> | Var 5   | Selects the variation of the analog signal change.  |

## Setting the analog change deadbands

Table. 5.3.6 - 75. Analog change deadband settings.

| Name                          | Range         | Step    | Default | Description   |
|-------------------------------|---------------|---------|---------|---|
| General deadband              | 0.110.0%      | 0.1%    | 2%      | Determines the general data reporting deadband settings.  |
| Active energy deadband        | 0.11000.0kWh  | 0.1kWh  | 2kWh    |   |
| Reactive<br>energy deadband   | 0.11000.0kVar | 0.1kVar | 2kVar   |   |
| Active power deadband         | 0.11000.0kW   | 0.1kW   | 2kW     |   |
| Reactive power deadband       | 0.11000.0kVar | 0.1kVar | 2kVar   |   |
| Apparent<br>power deadband    | 0.11000.0kVA  | 0.1kVA  | 2kVA    |   |
| Power factor deadband         | 0.010.99      | 0.01    | 0.05    | Determines the data reporting deadband  |
| Frequency deadband            | 0.011.00Hz    | 0.01Hz  | 0.1Hz   | settings for this measurement.  |
| Current deadband              | 0.0150.00A    | 0.01A   | 5A      |   |
| Residual current deadband     | 0.0150.00A    | 0.01A   | 0.2A    |   |
| Voltage deadband              | 0.015000.00V  | 0.01V   | 200V    |   |
| Residual<br>voltage deadband  | 0.015000.00V  | 0.01V   | 200V    |   |
| Angle<br>measurement deadband |               |         | 1deg    |   |
| Integration time              | 010 000ms     | 1ms     | 0ms     | Determines the integration time of the<br>protocol. If this parameter is set to "0 ms",<br>no integration time is in use. |

# 5.3.7 Modbus I/O

The Modbus I/O protocol can be selected to communicate on the available serial ports. The Modbus I/O is actually a Modbus/RTU master implementation that is dedicated to communicating with serial Modbus/RTU slaves such as RTD input modules. Up to three (3) Modbus/RTU slaves can be connected to the same bus polled by the Modbus I/O implementation. These are named I/O Module A, I/O Module B and I/O Module C. Each of the modules can be configured using parameters in the following two tables.

| Name                    | Range | Description   |
|-------------------------|-------|---|
| I/O module<br>X address | 0247  | Defines the Modbus unit address for the selected I/O Module (A, B, or C). If this setting is set to "0", the selected module is not in use. |

| Name               | Range  | Description  |
|--------------------|--|--|
| Module x<br>type   | <ul><li>ADAM-4018+</li><li>ADAM-4015</li></ul> | Selects the module type.                                 |
| Channels in<br>use | Channel<br>0Channel 7 (or<br>None)             | Selects the number of channels to be used by the module. |

#### Table. 5.3.7 - 77. Channel settings.

| Name                 | Range   | Step | Default | Description  |
|----------------------|---|------|---------|--|
| Thermocouple<br>type | <ul> <li>+/- 20mA</li> <li>420mA</li> <li>Type J</li> <li>Type K</li> <li>Type T</li> <li>Type E</li> <li>Type R</li> <li>Type S</li> </ul> | -    | 420mA   | Selects the thermocouple or the mA input connected to the I/O module.<br>Types J, K, T and E are nickel-alloy thermocouples, while Types R and S are platinum/rhodium-alloy thermocouples. |
| Input value          | -101.02<br>000.0  | 0.1  | -       | Displays the input value of the selected channel.  |
| Input status         | <ul><li>Invalid</li><li>OK</li></ul>  | -    | -       | Displays the input status of the selected channel.   |

# 5.4 Analog fault registers

At Communication  $\rightarrow$  General I/O  $\rightarrow$  Analog fault registers the user can set up to twelve (12) channels to record the measured value when a protection function starts or trips. These values can be read in two ways: locally from this same menu, or through a communication protocol if one is in use.

The following table presents the setting parameters available for the 12 channels.

| Table. | 5.4 - | 78. | Fault | register | settings. |
|--------|-------|-----|-------|----------|-----------|
| rabic. | 0.4   | 10. | raun  | register | Jornigg.  |

| Name                        | Range   | Step | Default        | Description  |
|-----------------------------|---|------|----------------|--|
| Select<br>record<br>source  | Not in use<br> >,  >>,  >>>,  >>>> (IL1, IL2,<br>IL3)<br>Id>, Id>>, Id>>>, Id>>>> (IL1, IL2,<br>IL2, IL3)<br>I0>, I0>>, I0>>>, I0>>>> (I0)<br>I0d>, I0d>>, I0d>>>, I0d>>>> (I0)<br>I0d>, I0d>>, I0d>>>, I0d>>>> (I0)<br>FLX (Fault locator) | -    | Not in<br>use  | Selects the protection function and its stage to be<br>used as the source for the fault register recording.<br>The user can choose between non-directional<br>overcurrent, directional overcurrent, non-directional<br>earth fault, directional earth fault, and fault locator<br>functions. |
| Select<br>record<br>trigger | <ul><li>TRIP signal</li><li>START signal</li><li>START and TRIP signals</li></ul>   | -    | TRIP<br>signal | Selects what triggers the fault register recording:<br>the selected function's TRIP signal, its START<br>signal, or either one.  |

| N                | Name | Range                        | Step | Default | Description   |
|------------------|------|------------------------------|------|---------|---|
| Re<br>fau<br>val | lit  | - 1000 000.001 000<br>000.00 | 0.01 | -       | Displays the recorded measurement value at the time of the selected fault register trigger. |

## 5.5 Modbus Gateway

Figure. 5.5 - 23. Example setup of Modbus Gateway application.

Any AQ-250 device can be setup as a Modbus Gateway (i.e. master). Modbus Gateway device can import messages (measurements, status signals etc.) from external Arcteq and third-party devices. RS-485 serial communication port. Up to 32 sub units can be connected to an AQ-200 master unit. These messages can then be used for controlling logic in the master device, display the status in user created mimic. Binary signals can be reported forward to SCADA with IEC61850, IEC101, IEC103, IEC104, Modbus, DNP3 or SPA.

Arc protection relays AQ-103 and AQ-103 LV Modbus variant is designed to work as a sub unit with Modbus Gateway master. More details about AQ-103 and AQ-103 LV capabilities and how to set them up can be found in *AQ-103 Instruction manual* (arcteq.fi./downloads/). Also see application example at the end of this chapter.

Modbus Gateway and its basic settings can be found from *Communication*  $\rightarrow$  *Modbus Gateway*. General settings-menu displays the health of connection to each sub unit.

#### Table. 5.5 - 79. General settings

| Name                              | Range  | Description  |
|-----------------------------------|--|--|
| Modbus Gateway<br>mode            | <ul><li>Disabled<br/>(Default)</li><li>Enabled</li></ul>   | Enables or disables Modbus Gateway.  |
| Modbus Gateway reconfigure        | -<br>Reconfigure   | Setting this parameter to "Reconfigure" takes new settings into use.<br>Parameter returns back to "-" automatically. |
| Quality of Modbus<br>Sub unit 132 | <ul> <li>OK</li> <li>Old data</li> <li>Data<br/>questionable</li> <li>Modbus<br/>error</li> <li>Send fail</li> <li>Receive fail</li> </ul> | Quality of each connected sub unit.  |

## Imported signals

Modbus Gateway supports importing of measurements, bits, double bits, counters and integer signals. Up to 128 signals can be imported of each signal type with the exception of double bits (32).

Table. 5.5 - 80. Imported signals

| Name                          | Range                 |
|-------------------------------|-----------------------|
| Imported measurement 1-128    | -3.4E+383.4E+38       |
| Imported bit signal 1-128     | 01                    |
| Imported double bit data 1-32 | 03                    |
| Imported counter data 1-128   | 04294967295           |
| Imported integer signal 1-128 | -21474836482147483647 |

To assign the signals use Modbus Gateway editor (*Tools*  $\rightarrow$  *Communication*  $\rightarrow$  *Modbus Gateway*). Detailed description of this tool can be found in AQtivate 200 Instruction manual (arcteq.fi./downloads/).

All imported signals can be given a description. The description will be displayed in most of menus with the signal (logic editor, matrix, block settings etc.).

| Name                           | Range             | Default          | Description   |
|--------------------------------|-------------------|------------------|---|
| Describe<br>measurement x      |                   | Acq.<br>Meas x   |   |
| Describe bit<br>signal x       | 131<br>characters | Acq. Bit<br>x    | User settable description for the signal. This description is used in several menu types for easier identification. |
| Describe doube<br>bit signal x |                   | Acq.<br>Binary x |   |

Table. 5.5 - 81. Imported signal user description.

| Name                         | Range | Default              | Description |
|------------------------------|-------|----------------------|-------------|
| Describe<br>counter signal x |       | Acq.<br>Counter<br>x |             |
| Describe integer<br>signal x |       | Acq.<br>Integer x    |             |

### **Events**

The Modbus Gateway generates events the status changes in imported bits and double bits. The user can select which event messages are stored in the main event buffer: ON, OFF, or both.

| Event block name | Event names  |
|------------------|--|
| MGWB1            | Bit 1Bit 32 (ON, OFF)  |
| MGWB2            | Bit 33Bit 64 (ON, OFF)                                       |
| MGWB3            | Bit 65Bit 96 (ON, OFF)                                       |
| MGWB4            | Bit 97Bit 128 (ON, OFF)                                      |
| MGWD1            | Double Bit 1 Double bit 16 (ON/ON, OFF/OFF, ON/OFF, OFF/ON)  |
| MGWD2            | Double Bit 17 Double bit 32 (ON/ON, OFF/OFF, ON/OFF, OFF/ON) |

## Connect AQ-103 devices to Modbus Gateway device

AQ-103 is a sophisticated microprocessor-based arc flash protection unit for arc light detection. AQ-103 acts as a sub-unit to AQ-110P (or, AQ-110F) in an AQ-100 arc protection system. It can also function as a stand-alone unit in light-only systems. AQ-103 provides communication through RS-485 and Modbus protocol as ordering options. Through the Modbus communication AQ-103 connects to an AQ-250 device for indication of exact fault location and to a SCADA system either trough a AQ-250 device or RTU.

AQ-103 Modbus variant is able to report various signals like number of installed sensors, sensor activations, I/O activations etc. Holding registers of each signal can be found in the AQ-103 instruction manual.

Figure. 5.5 - 24. AQ-250 device can receive signals through modbus and use them to control logic of the device, create mimics and report the values to IEC 61850.

The signals received from AQ-103 device can be used for fault indications on AQ-200 device and for reporting the signals forward with IEC 61850 or other communication protocol. Fault indication can be done by setting up an alarm display for each incoming signal or by building a mimic.

Figure. 5.5 - 25. To report imported bit signals to SCADA the signals must be connected to a logical output.

# 6 Connections and application examples

# 6.1 Connections of AQ-S254

Figure. 6.1 - 28. AQ-S254 application example.

# 7 Construction and installation

# 7.1 Construction

AQ-X254 is a member of the modular and scalable AQ-200 series, and it includes 14 configurable and modular add-on card slots. As a standard configuration the device includes the CPU module (which consists of the CPU, a number of inputs and outputs, and the power supply).

The images below present the modules of both the non-optioned model (AQ-X254-XXXXXX-AAAAAAAAAAAAAAA) and the almost fully optioned model (AQ-X254-XXXXXX-BBBBBBBBBBBBBBBAAJ).

The modular structure of AQ-X254 allows for scalable solutions for different application requirements. In non-standard configurations Slots A to N accept all available add-on modules, such as digital I/O modules and other special modules. The only difference between the slots affecting device scalability is that Slots M and N also support communication options.

Start-up scan searches for modules according to their type designation code. If the module content is not what the device expects, the device issues a hardware configuration error message. In field upgrades, therefore, add-on modules must be ordered from Arcteq Relays Ltd. or its representative who can then provide the module with its corresponding unlocking code to allow the device to operate correctly once the hardware configuration has been upgraded.

When an I/O module is inserted into the device, the module location affects the naming of the I/O. The I/O scanning order in the start-up sequence is as follows: the CPU module I/O, Slot A, Slot B, Slot C, and so on. This means that the digital input channels DI1, DI2 and DI3 as well as the digital output channels OUT1, OUT2, OUT3, OUT4 and OUT5 are always located in the CPU module. If additional I/O cards are installed, their location and card type affect the I/O naming.

The figure below presents the start-up hardware scan order of the device as well as the I/O naming principles.

| Figure, 7.1 - 31. Hardware    | scanning and IO naming | g principle in AQ-X254 devices. |

#### 1. Scan

The start-up system; detects and self-tests the CPU module, voltages, communication and the I/O; finds and assigns "DI1", "DI2", "DI3", "OUT1", "OUT2", "OUT3", "OUT4" and "OUT5".

2. Scan

Scans Slot A, and moves to the next slot if Slot A is empty. If the scan finds an 8DI module (that is, a module with eight digital inputs), it reserves the designations "DI4", "DI5", "DI6", "DI7", "DI8", "DI9", "DI9", "DI10" and "DI11" to this slot. If the scan finds a DO5 module (that is, a module with five digital outputs), it reserves the designations "OUT6", "OUT7", "OUT8", "OUT9" and "OUT10" to this slot. The I/O is then added if the type designation code (e.g. AQ-P215-PH0AAAA-BBC) matches with the existing modules in the device. If the code and the modules do not match, the device issues and alarm. An alarm is also issued if the device expects to find a module here but does not find one.

3. Scan

Scans Slot B, and moves to the next slot if Slot B is empty. If the scan finds an 8DI module, it reserves the designations "DI4", "DI5", "DI6", "DI7", "DI8", "DI9", "DI10" and "DI11" to this slot. If Slot A also has an 8DI module (and therefore has already reserved these designations), the device reserves the designations "DI12", "DI13", "DI14", "DI15", "DI16", "DI17", "DI18" and "DI19" to this slot. If the scan finds a 5DO module, it reserves the designations "OUT6", "OUT7", "OUT8", "OUT9" and "OUT10" to this slot. Again, if Slot A also has a 5DO and has therefore already reserved these designations, the device reserves the designations "OUT11", "OUT12", "OUT13", "OUT14" and "OUT15" to this slot.

4. -15. Scan

A similar operation to Scan 3 (checks which designations have been reserved by modules in previous slots and numbers the new ones accordingly).

Thus far this chapter has only explained the installation of I/O add-on cards to the option module slots. This is because all other module types are treated in a same way. For example, when an additional communication port is installed into the upper port of the communication module, its designation is Communication port 3 or higher, as Communication ports 1 and 2 already exist in the CPU module (which is scanned, and thus designated, first). After a communication port is detected, it is added into the device's communication space and its corresponding settings are enabled.

The almost fully optioned example case of AQ-X254-XXXXX-BBBBBBBBBBBCAJ (the first image pair, on the right) has a total of 91 digital input channels available: three (DI1...DI3) in the CPU module, and the rest in Slots A...K in groups of eight. It also has a total of 10 digital output channels available: five (DO1...DO5) in the CPU module, and five (DO6...DO10) in Slot L. These same principles apply to all non-standard configurations in the AQ-X254 devices.

## 7.2 CPU module

Figure. 7.2 - 32. CPU module.

| Connector | Description   |
|-----------|---|
| COM A     | Communication port A, or the RJ-45 port. Used for the setting tool connection and for IEC 61850, Modbus/TCP, IEC 104, DNP3 and station bus communications.  |
| СОМ В     | Communication port B, or the RS-485 port. Used for the SCADA communications for the following protocols: Modbus/RTU, Modbus I/O, SPA, DNP3, IEC 101 and IEC 103. The pins have the following designations: Pin 1 = DATA +, Pin 2 = DATA –, Pin 3 = GND, Pins 4 & 5 = Terminator resistor enabled by shorting. |
| X1-1      | Digital input 1, nominal threshold voltage 24 V, 110 V or 220 V.  |
| X1-2      | Digital input 2, nominal threshold voltage 24 V, 110 V or 220 V.  |
| X1-3      | Digital input 3, nominal threshold voltage 24 V, 110 V or 220 V.  |
| X1-4      | Common GND for digital inputs 1, 2 and 3.   |
| X1-5:6    | Output relay 1, with a normally open (NO) contact.  |
| X1-7:8    | Output relay 2, with a normally open (NO) contact.  |

Connector Description X1-9:10 Output relay 3, with a normally open (NO) contact. X1-11:12 Output relay 4, with a normally open (NO) contact. X1-13:14:15 Signaling relay 5, with a changeover contact. Not to be used in trip coil control. System fault's signaling relay, with a changeover contact. Pins 16 and 17 are closed when the X1-16:17:18 unit has a system fault or is powered OFF. Pins 16 and 18 are closed when the unit is powered ON and there is no system fault. Power supply IN. Either 80...265 VAC/DC (model A; order code "H") or 18...75 DC (model X1-19:20 B; order code "L"). Positive side (+) to Pin 20. GND The device's earthing connector.

By default, the CPU module (combining the CPU, the I/O and the power supply) includes two standard communication ports and the device's basic digital I/O.

The digital output controls are also set by the user with software. The digital outputs are controlled in 5 ms program cycles. All output contacts are mechanical. The rated voltage of the NO/NC outputs is 250 VAC/DC.

The auxiliary voltage is defined in the ordering code: the available power supply models available are A (80...265 VAC/DC) and B (18...75 DC). The power suppy's minimum allowed bridging time for all voltage levels is above 150 ms. The power supply's maximum power consumption is 15 W. The power supply allows a DC ripple of below 15 % and the start-up time of the power supply is below 5 ms. For further details, please refer to the "Auxiliary voltage" chapter in the "Technical data" section of this document.

## **Digital inputs**

The current consumption of the digital inputs is 2 mA when activated, while the range of the operating voltage is 24 V/110 V/220 V depending on the ordered hardware. All digital inputs are scanneed in 5 ms program cycles. Their pick-up and release thresholds depend on the selection of the order code. Their delays and NO/NC selection, however, can be set with software.

The settings described in the table below can be found at *Control*  $\rightarrow$  *Device*  $I/O \rightarrow$  *Digital input settings* in the device settings.

| Name                       | Range  | Step       | Default  | Description  |
|----------------------------|--|------------|----------|--|
| DIx Polarity               | <ul> <li>NO (Normally open)</li> <li>NC (Normally closed)</li> </ul> | -          | NO       | Selects whether the status of the digital input is 1 or 0 when the input is energized.         |
| DIx<br>Activation<br>delay | 0.0001800.000<br>s   | 0.001<br>s | 0.000 s  | Defines the delay for the status change from 0 to 1.   |
| DIx Drop-<br>off time      | 0.0001800.000<br>s   | 0.001<br>s | 0.000 s  | Defines the delay for the status change from 1 to 0.   |
| DIx AC<br>mode             | <ul><li>Disabled</li><li>Enabled</li></ul>                           | -          | Disabled | Selects whether or not a 30-ms deactivation delay is added to account for alternating current. |

Table. 7.2 - 83. Digital input settings.

## Digital input and output descriptions

CPU card digital inputs and outputs can be given a description. The user defined description are displayed in most of the menus:

- logic editor
- matrix
- block settings
- event history
- disturbance recordings
- etc.

Table. 7.2 - 84. Digital input and output user description.

| Name                              | Range      | Default | Description  |
|-----------------------------------|------------|---------|--|
| User editable description DIx     | 131        | DIx     | Description of the digital input. This description is used in several menu types for easier identification.  |
| User editable<br>description OUTx | characters | OUTx    | Description of the digital output. This description is used in several menu types for easier identification. |

#### NOTICE!

After editing user descriptions the event history will start to use the new description only after resetting the HMI. HMI can be reset from *General*  $\rightarrow$  *Device info*  $\rightarrow$  *HMI restart*.

## Scanning cycle

1

i

All digital inputs are scanned in a 5 ms cycle, meaning that the state of an input is updated every 0...5 milliseconds. When an input is used internally in the device (either in group change or logic), it takes additional 0...5 milliseconds to operate. Theoretically, therefore, it takes 0...10 milliseconds to change the group when a digital input is used for group control or a similar function. In practice, however, the delay is between 2...8 milliseconds about 95 % of the time. When a digital input is connected directly to a digital output (T1...Tx), it takes an additional 5 ms round. Therefore, when a digital input controls a digital output internally, it takes 0...15 milliseconds in theory and 2...13 milliseconds in practice.

### NOTICE!

The mechanical delay of the relay is <u>not</u> included in these approximations!

# 7.3 Option cards

# 7.3.1 Digital input module (optional)

Figure. 7.3.1 - 33. Digital input module (DI8) with eight add-on digital inputs.

| X 8       | DIx + 7  |
| Х9        | DIx + 8  |
| X 10      | Common earthing for the other four digital inputs.   |

The DI8 module is an add-on module with eight (8) galvanically isolated digital inputs. This module can be ordered directly to be installed into the device in the factory, or it can be upgraded in the field after the device's original installation when required. The properties of the inputs in this module are the same as those of the inputs in the main processor module. The current consumption of the digital inputs is 2 mA when activated, while the range of the operating voltage is from 0...265 VAC/DC. The activation and release thresholds are set in the software and the resolution is 1 V. All digital inputs are scannced in 5 ms program cycles, and their pick-up and release delays as well as their NO/NC selection can be set with software.

For the naming convention of the digital inputs provided by this module please refer to the chapter titled "Construction and installation".

For technical details please refer to the chapter titled "Digital input module" in the "Technical data" section of this document.

## Setting up the activation and release delays

The settings described in the table below can be found at *Control*  $\rightarrow$  *Device I/O*  $\rightarrow$  *Digital input settings* in the device settings.

| Name                           | Range  | Step       | Default  | Description   |
|--------------------------------|--|------------|----------|---|
| Dlx<br>Polarity                | <ul> <li>NO (Normally open)</li> <li>NC (Normally closed)</li> </ul> | -          | NO       | Selects whether the status of the digital input is 1 or 0 when the input is energized.  |
| DIx<br>Activation<br>threshold | 16.0200.0 V  | 0.1 V      | 88 V     | Defines the activation threshold for the digital input.<br>When "NO" is the selected polarity, the measured voltage<br>exceeding this setting activates the input. When "NC" is the<br>selected polarity, the measured voltage exceeding this<br>setting deactivates the input. |
| DIx<br>Release<br>threshold    | 10.0200.0 V  | 0.1 V      | 60V      | Defines the release threshold for the digital input.<br>When "NO" is the selected polarity, the measured voltage<br>below this setting deactivates the input. When "NC" is the<br>selected polarity, the measured voltage below this setting<br>activates the input.            |
| Dlx<br>Activation<br>delay     | 0.0001800.000<br>s   | 0.001<br>s | 0.000 s  | Defines the delay when the status changes from 0 to 1.  |
| DIx Drop-<br>off time          | 0.0001800.000<br>s   | 0.001<br>s | 0.000 s  | Defines the delay when the status changes from 1 to 0.  |
| DIx AC<br>Mode                 | <ul><li>Disabled</li><li>Enabled</li></ul>                           | -          | Disabled | Selects whether or not a 30-ms deactivation delay is added<br>to take the alternating current into account. The "DIx Release<br>threshold" parameter is hidden and forced to 10 % of the set<br>"DIx Activation threshold" parameter.   |
| Dlx<br>Counter                 | 02 <sup>32</sup> –1  | 1          | 0        | Displays the number of times the digital input has changed its status from 0 to 1.  |
| Dlx Clear<br>counter           | • -<br>• Clear   | -          | -        | Resets the DIx counter value to zero.   |

Table. 7.3.1 - 85. Digital input settings of DI8 module.

The user can set the activation threshold individually for each digital input. When the activation and release thresholds have been set properly, they will result in the digital input states to be activated and released reliably. The selection of the normal state between normally open (NO) and normally closed (NC) defines whether or not the digital input is considered activated when the digital input channel is energized.

The diagram below depicts the digital input states when the input channels are energized and deenergized.

## **Digital input descriptions**

Option card inputs can be given a description. The user defined description are displayed in most of the menus:

- logic editor
- matrix
- block settings
- event history
- disturbance recordings
- etc.

Table. 7.3.1 - 86. Digital input user description.

| Name                             | Range             | Default | Description   |
|----------------------------------|-------------------|---------|---|
| User editable<br>description Dlx | 131<br>characters | DIx     | Description of the digital input. This description is used in several menu types for easier identification. |

### NOTICE!

After editing user descriptions the event history will start to use the new description only after resetting the HMI. HMI can be reset from *General*  $\rightarrow$  *Device info*  $\rightarrow$  *HMI restart*.

## Digital input voltage measurements

Digital input option card channels measure voltage on each channel. The measured voltage can be seen at *Control*  $\rightarrow$  *Device IO*  $\rightarrow$  *Digital inputs*  $\rightarrow$  *Digital input voltages*.

| Table. 7.3.1 - 87. Digital input channel voltage | measurement. |
|--|--------------|
|--|--------------|

| Name            | Range          | Step    | Description                                     |
|-----------------|----------------|---------|---|
| DIx Voltage now | 0.000275.000 V | 0.001 V | Voltage measurement of a digital input channel. |

|                          |           |             |

{{Default-Series}}. 7.3.2 - 1.

| Connector | Description  |
|-----------|--|
| X 1–2     | OUTx + 1 (1 <sup>st</sup> and 2 <sup>nd</sup> pole NO) |
| X 3-4     | OUTx + 2 (1 <sup>st</sup> and 2 <sup>nd</sup> pole NO) |
| X 56      | OUTx + 3 (1 <sup>st</sup> and 2 <sup>nd</sup> pole NO) |
| X 7–8     | OUTx + 4 (1 <sup>st</sup> and 2 <sup>nd</sup> pole NO) |
| X 9–10    | OUTx + 5 (1 <sup>st</sup> and 2 <sup>nd</sup> pole NO) |

The DO5 module is an add-on module with five (5) digital outputs. This module can be ordered directly to be installed into the device in the factory, or it can be upgraded in the field after the device's original installation when required. The properties of the outputs in this module are the same as those of the outputs in the main processor module. The user can set the digital output controls with software. All digital outputs are scanned in 5 ms program cycles, and their contacts are mechanical in type. The rated voltage of the NO/NC outputs is 250 VAC/DC.

For the naming convention of the digital inputs provided by this module please refer to the chapter titled "Construction and installation".

For technical details please refer to the chapter titled "Digital output module" in the "Technical data" section of this document.

### **Digital output descriptions**

Option card outputs can be given a description. The user defined description are displayed in most of the menus:

AQ-S254 Instruction manual

Version: 2.12

- logic editor
- matrix
- block settings
- event history
- disturbance recordings
- etc.

Table. 7.3.2 - 88. Digital output user description.

| Name                           | Range             | Default | Description  |
|--------------------------------|-------------------|---------|--|
| User editable description OUTx | 131<br>characters | OUTx    | Description of the digital output. This description is used in several menu types for easier identification. |

#### NOTICE!

After editing user descriptions the event history will start to use the new description only after resetting the HMI. HMI can be reset from *General*  $\rightarrow$  *Device info*  $\rightarrow$  *HMI restart*.

|           | 3   |                          | Not in use.  |  |
|           | 4   | -                        | not in use.  |  |
|           | 5   | RS-232 RTS               |  |  |
|           | 6   | RS-232 GND               | Serial based communications.   |  |
| COM F     | 7   | RS-232 TX                |  |  |
|           | 8   | RS-232 RX                |  |  |
|           | 9   | -                        | Not in use.  |  |
|           | 10  | +3.3 V output<br>(spare) | Spare power source for external equipment (45 mA).   |  |
|           | 11  | Clock sync<br>input      | Clock synchronization input (supports IPIC P)  |  |
|           | 12  | Clock sync<br>GND        | Clock synchronization input (supports IRIG-B).   |  |

The option card includes two serial communication interfaces: COM E is a serial fiber interface with glass/glass, plastic/plastic, glass/plastic and plastic/glass options, COM F is an RS-232 interface.

# 7.3.5 LC or RJ45 100 Mbps Ethernet communication module (optional)

Figure. 7.3.5 - 39. LC and RJ45 100 Mbps Ethernet module connectors.

| Connector | Description (LC ports)   | Description (RJ45)   |
|-----------|--|--|
| COM C:    | <ul> <li>Communication port C, 100 MbpsLC fiber connector.</li> <li>62.5/125 µm or 50/125 µm multimode (glass).</li> <li>Wavelength 1300 nm.</li> </ul>  | <ul><li>RJ-45 connectors</li><li>10BASE-T and 100BASE-TX</li></ul> |
| COM D:    | <ul> <li>Communication port D, 100 Mbps LC fiber connector.</li> <li>62.5/125 µm or 50/125 µm multimode (glass).</li> <li>Wavelength 1300 nm.</li> </ul> | <ul><li>RJ-45 connectors</li><li>10BASE-T and 100BASE-TX</li></ul> |

Both cards support both HSR and PRP protocols.

# 7.3.6 Double ST 100 Mbps Ethernet communication module (optional)

| Connector         | Description  |
|-------------------|--|
| Two-pin connector | IRIG-B input   |
| ST connectors     | <ul> <li>Duplex ST connectors</li> <li>62.5/125 µm or 50/125 µm multimode fiber</li> <li>Transmitter wavelength: 12601360 nm (nominal: 1310 nm)</li> <li>Receiver wavelength: 11001600 nm</li> <li>100BASE-FX</li> <li>Up to 2 km</li> </ul> |

This option cards supports redundant ring configuration and multidrop configurations. Please note that each ring can only contain AQ-200 series devices, and any third party devices must be connected to a separate ring.

# 7.3.7 Double RJ45 10/100 Mbps Ethernet communication module (optional)

| Connector         | Description  |
|-------------------|--------------|
| Two-pin connector | IRIG-B input |

| Connector        | Description   |  |
|------------------|---|--|
| RJ-45 connectors | <ul> <li>Two Ethernet ports</li> <li>RJ-45 connectors</li> <li>10BASE-T and 100BASE-TX</li> </ul> |  |

This option card supports multidrop configurations.

## 7.4 Dimensions and installation

The device can be installed either to a standard 19" rack or to a switchgear panel with cutouts. The desired installation type is defined in the order code. When installing to a rack, the device takes a half  $(\frac{1}{2})$  of the rack's width, meaning that a total of two devices can be installed to the same rack next to one another.

The figures below describe the device dimensions (first figure), the device installation (second), and the panel cutout dimensions and device spacing (third).

#### Figure. 7.4 - 44. Device dimensions.

Figure. 7.4 - 45. Device installation.

| Remote                     | Force change overrule of local controls either from the setting tool, HMI or SCADA |  |
| Operation time             |  |  |
| Reaction time              | <5 ms from receiving the control signal  |  |

# 8.2.1.2 Object control and monitoring

Table. 8.2.1.2 - 107. Technical data for the object control and monitoring function.

| General                                       |   |  |
|---|---|--|
| Number of objects                             | 10  |  |
| Supported object types                        | Circuit breaker<br>Circuit breaker with withdrawable cart<br>Disconnector (MC)<br>Disconnector (GND)<br>Custom object image |  |
| Signals                                       |   |  |
| Input signals                                 | Digital inputs<br>Software signals  |  |
| Output signals                                | Close command output<br>Open command output   |  |
| Operation time                                |   |  |
| Breaker traverse time setting                 | 0.02500.00 s, setting step 0.02 s   |  |
| Max. close/open command pulse length          | 0.02500.00 s, setting step 0.02 s   |  |
| Control termination time out setting          | 0.02500.00 s, setting step 0.02 s   |  |
| Inaccuracy:<br>- Definite time operating time | ±0.5 % or ±10 ms  |  |
| Breaker control operation time                |   |  |
| External object control time                  | <75 ms  |  |
| Object control during auto-reclosing          | See the technical sheet for the auto-reclosing function.  |  |

Table. 8.2.1.2 - 108. Technical data for the circuit breaker wear monitoring function.

| Pick-up  |  |  |
|--|--|--|
| Breaker characteristics settings:<br>- Nominal breaking current<br>- Maximum breaking current<br>- Operations with nominal current<br>- Operations with maximum breaking current | 0.00100.00 kA, setting step 0.001 kA<br>0.00100.00 kA, setting step 0.001 kA<br>0200 000 operations, setting step 1 operation<br>0200 000 operations, setting step 1 operation |  |
| Pick-up setting for Alarm 1 and Alarm 2  | 0200 000 operations, setting step 1 operation  |  |
| Inaccuracy   |  |  |
| Inaccuracy for current/operations counter:<br>- Current measurement element<br>- Operation counter   | $0.1\times$ I_N > I < $2\times$ I_N $\pm 0.2$ % of the measured current, rest 0.5 % $\pm 0.5$ % of operations deducted   |  |

# 8.2.1.3 Indicator object monitoring

Table. 8.2.1.3 - 109. Technical data for the indicator object monitoring function.

| General                |   |  |
|------------------------|---|--|
| Number of objects      | 20  |  |
| Supported object types | Disconnector (GND)<br>Custom object image |  |
| Signals                |   |  |
| Input signals          | Digital inputs<br>Software signals        |  |

# 8.2.2 Monitoring functions

## 8.2.2.1 Disturbance recorder

Table. 8.2.2.1 - 110. Technical data for the disturbance recorder function.

| Recorded values   |  |  |
|---|--|--|
| Recorder<br>analog channels   | 020 channels<br>Freely selectable  |  |
| Recorder digital<br>channels     095 channels       Freely selectable analog and binary signals<br>5 ms sample rate (FFT) |  |  |
| Performance   |  |  |
| Sample rate   | 8, 16, 32 or 64 samples/cycle  |  |
| Recording length  | 0.0001800.000 s, setting step 0.001 s<br>The maximum length is determined by the chosen signals.   |  |
| Number of recordings  | 0100, 60 MB of shared flash memory reserved<br>The maximum number of recordings according to the chosen signals and operation time<br>setting combined |  |

# 8.2.2.2 Event logger

Table. 8.2.2.2 - 111. Technical data for the event logger function.

| General information        |               |
|----------------------------|---------------|
| Event history capacity     | 15 000 events |
| Event timestamp resolution | 1 ms          |

# 8.3 Tests and environmental

## Electrical environment compatibility

Table. 8.3 - 112. Disturbance tests.

| All tests  | CE-approved and tested according to EN 60255-26  |  |  |  |  |
|--|--|--|--|--|--|
| Emissions  |  |  |  |  |  |
| Conducted emissions:<br>EN 60255-26 Ch. 5.2, CISPR 22            | 150 kHz30 MHz  |  |  |  |  |
| Radiated emissions:<br>EN 60255-26 Ch. 5.1, CISPR 11             | 301 000 MHz  |  |  |  |  |
| Immunity   |  |  |  |  |  |
| Electrostatic discharge (ESD):<br>EN 60255-26, IEC 61000-4-2     | Air discharge 15 kV<br>Contact discharge 8 kV  |  |  |  |  |
| Electrical fast transients (EFT):<br>EN 60255-26, IEC 61000-4-4  | Power supply input 4 kV, 5/50 ns, 5 kHz<br>Other inputs and outputs 4 kV, 5/50 ns, 5 kHz |  |  |  |  |
| Surge:<br>EN 60255-26, IEC 61000-4-5                             | Between wires: 2 kV, 1.2/50 µs<br>Between wire and earth: 4 kV, 1.2/50 µs                |  |  |  |  |
| Radiated RF electromagnetic field:<br>EN 60255-26, IEC 61000-4-3 | f = 801 000 MHz, 10 V/m  |  |  |  |  |
| Conducted RF field:<br>EN 60255-26, IEC 61000-4-6                | f = 150 kHz80 MHz, 10 V (RMS)  |  |  |  |  |

#### Table. 8.3 - 113. Voltage tests.

| Dielectric voltage test              |                        |  |  |  |  |  |  |  |
|--------------------------------------|------------------------|--|--|--|--|--|--|--|
| EN 60255-27, IEC 60255-5, EN 60255-1 | 2 kV, 50 Hz, 1 min     |  |  |  |  |  |  |  |
| Impulse voltage test                 |                        |  |  |  |  |  |  |  |
| EN 60255-27, IEC 60255-5             | 5 kV, 1.2/50 μs, 0.5 J |  |  |  |  |  |  |  |

## Physical environment compatibility

Table. 8.3 - 114. Mechanical tests.

| Vibration test                          |   |
|---|---|
| EN 60255-1, EN 60255-27, IEC 60255-21-1 | 213.2 Hz, ± 3.5 mm<br>13.2100 Hz, ± 1.0 g |
| Shock and bump test                     |   |
| EN 60255-1, EN 60255-27, IEC 60255-21-2 | 20 g, 1 000 bumps/dir.                    |

### Table. 8.3 - 115. Environmental tests.

| Damp heat (cyclic)         |  |  |  |  |  |  |  |  |
|----------------------------|--|--|--|--|--|--|--|--|
| EN 60255-1, IEC 60068-2-30 | Operational: +25+55 °C, 9397 % (RH), 12+12h        |  |  |  |  |  |  |  |
| Dry heat                   |  |  |  |  |  |  |  |  |
| EN 60255-1, IEC 60068-2-2  | Storage: +70 °C, 16 h<br>Operational: +55 °C, 16 h |  |  |  |  |  |  |  |
| Cold test                  |  |  |  |  |  |  |  |  |
| EN 60255-1, IEC 60068-2-1  | Storage: –40 °C, 16 h<br>Operational: –20 °C, 16 h |  |  |  |  |  |  |  |

Table. 8.3 - 116. Environmental conditions.

| IP classes                              |                             |  |  |  |  |
