Disclaimer

Please read these instructions carefully before using the equipment or taking any other actions with respect to the equipment. Only trained and qualified persons are allowed to perform installation, operation, service or maintenance of the equipment. Such qualified persons have the responsibility to take all appropriate measures, including e.g. use of authentication, encryption, anti-virus programs, safe switching programs etc. necessary to ensure a safe and secure environment and usability of the equipment. The warranty granted to the equipment remains in force only provided that the instructions contained in this document have been strictly complied with.

Nothing contained in this document shall increase the liability or extend the warranty obligations of the manufacturer Arcteq Relays Ltd. The manufacturer expressly disclaims any and all liability for any damages and/or losses caused due to a failure to comply with the instructions contained herein or caused by persons who do not fulfil the aforementioned requirements. Furthermore, the manufacturer shall not be liable for possible errors in this document.

Please note that you must always comply with applicable local legislation and regulations. The manufacturer gives no warranties that the content of this document is in all respects in line with local laws and regulations and assumes no liability for such possible deviations.

You are advised to notify the manufacturer in case you become aware of any errors in this document or of defects in the equipment.

The manufacturer reserves the right to update or amend this document at any time.

1 Document information

1.1 Version 2 revision notes

Table. 1.1 - 1. Version 2 revision notes

Revision	2.00
Date	6.6.2019
Changes	<ul style="list-style-type: none"> - New more consistent look. - Improved descriptions generally in many chapters. - Improved readability of a lot of drawings and images. - Updated protection functions included in every manual. - Every protection relay type now has connection drawing, application example drawing with function block diagram and application example with wiring. - Added current measurement side selection description to functions with such feature. - Added General-menu description.
Revision	2.01
Date	6.11.2019
Changes	<ul style="list-style-type: none"> - Added description for LED test and button test. - Complete rewrite of every chapter. - Improvements to many drawings and formula images. - Order codes revised. - Added double ST 100 Mbps Ethernet communication module and Double RJ45 10/100 Mbps Ethernet communication module descriptions
Revision	2.02
Date	7.7.2020
Changes	- A number of image descriptions improved.
Revision	2.03
Date	27.8.2020

Changes	<ul style="list-style-type: none"> - Terminology consistency improved (e.g. binary inputs are now always called digital inputs). - Tech data modified to be more informative about what type of measurement inputs are used (phase currents/voltages, residual currents/voltages), what component of that measurement is available (RMS, TRMS, peak-to-peak) and possible calculated measurement values (powers, impedances, angles etc.). - Tech data updated: non-directional overcurrent - Tech data updated: non-directional earthfault - Tech data updated: current unbalance - Tech data updated: transformer differential - Improvements to many drawings and formula images. - Improved and updated device user interface display images. - AQ-T216 Functions included list Added: Running hour counter, cold load pick-up, indicator objects, programmable control switch, mA output control and measurement recorder. - Added 6th harmonic to harmonic overcurrent protection function. - Changed disturbance recorder maximum digital channel amount from 32 to 95. - Added residual current coarse and fine measurement data to disturbance recorder description. - HSO1 and HSO2 connection swapped in arc protection card (was way wrong before). - Updated IO1 and IO2 rated current range. - Added inches to Dimensions and installation chapter. - Added raising frames, wall mounting bracket, combiflex frame to order code. - Added logical input and logical output function descriptions. - Additions to Abbreviations chapter. - Added button test description to Local panel structure chapter. - Added Fault register view to Basic configuration chapter. - Added parameter descriptions to General menu Device user interface chapter. - Protection device user interface chapter almost completely rewritten and restructured. - Added new parameter descriptions to Monitoring menu device user interface chapter. - Added note to Configuring user levels and passwords chapter that user level with a password automatically locks itself after 30 minutes of inactivity. - Added more "Tripped stage" indications and fault types to Measurement value recorder function. - Updated: Digital input activation and release threshold setting ranges and added drop-off delay setting. - Added sample rate to voltage and current measurement tech data.
Revision	2.04
Date	8.6.2021
Changes	<ul style="list-style-type: none"> - Increased the consistency in terminology - Various image upgrades - Visual update to the order codes
Revision	2.05
Date	22.6.2021
Changes	<ul style="list-style-type: none"> - Fixed phase current measurement continuous thermal withstand from 30A to 20A. - Fixed lots of timing errors written to registers table. "Prefault" is -200 ms from Start event, "Pretrigger" is -20 ms from trip (or start if fault doesn't progress to trip), "Fault" is start (or trip if fault doesn't progress to trip). - Added event history technical data
Revision	2.06
Date	21.6.2022

Changes	<ul style="list-style-type: none"> - Improved descriptions generally in many chapters. - Improved readability of a lot of drawings and images. - Order codes have been revised. - Fixed bias calculation formula for restricted earth fault function. Was correctly in the code, just written wrong in the manual. - Added power measurement side selection to power functions. - Added new trip detections and fault types to measurement value recorder. - Added user description parameter descriptions for digital inputs, digital outputs, logical inputs, logical outputs and GOOSE inputs. - Arc point sensor HSO1 and HSO2 position fixed. - Added spare part codes and compatibilities to option cards.
Revision	2.07
Date	7.7.2022
Changes	
Revision	2.08
Date	8.9.2022
Changes	<ul style="list-style-type: none"> - Added stage forcing parameter to function descriptions. - Fixes to "Real time signals to comm" description. - Added "Ethernet port" parameter description to IEC61850, IEC104 and Modbus TCP descriptions. - Removed "Measurement update interval" settings from Modbus description. No longer in use. - Renamed "System integration" chapter to "Communication" and restructured the chapters to be closer to how they are in the menus. - Added "Event logger" chapter.
Revision	2.09
Date	14.3.2023
Changes	<ul style="list-style-type: none"> - Updated the Arcteq logo on the cover page and refined the manual's visual look. - Added the "Safety information" chapter and changed the notes throughout the document accordingly. - Changed the "IED user interface" chapter's title to "Device user interface" and replaced all 'IED' terms with 'device' or 'unit'. - Updated the rated values for the change-over CPU digital outputs in "Technical data". - Added the maximum and minimum allowed tracking frequencies to the settings table of the "Frequency tracking and scaling" chapter (under "Measurements").
Revision	2.10
Date	19.6.2023
Changes	- Updated order codes.
Revision	2.11
Date	29.11.2023
Changes	<ul style="list-style-type: none"> - Added the 5 ms update time in the measurement chapters. - Added spring lock cage options for connectors. See the "Ordering information" chapter. - Updated the contact address for technical support in the "Contact and reference information" chapter.
Revision	2.12

Date	January 2024
Changes	- Added "I2 meas / I2 set" and other read-only parameters to " I2> function ". - Added Chinese and Kazakh languages as language options in " General menu ".
Revision	2.13
Date	September 2024
Changes	- Added 5th harmonic maximum uptime parameter to transformer differential protection function. - Corrected the number of devices that fit a 19 in rack in the " Dimensions and installation " chapter.

1.2 Version 1 revision notes

Table. 1.2 - 2. Version 1 revision notes

Revision	1.00
Date	18.11.2014
Changes	<ul style="list-style-type: none"> The first revision for AQ-T215.
Revision	1.01
Date	26.1.2015
Changes	<ul style="list-style-type: none"> Added the double LC 100Mb Ethernet module and the RS-232 & serial fiber module hardware descriptions. Added the system integration text for the SPA protocol. Replaced the positive and negative sequence overvoltage function with the sequence voltage function. Order code updated.
Revision	1.02
Date	30.5.2015
Changes	<ul style="list-style-type: none"> Added the PCB and Terminal options to the order code.
Revision	1.03
Date	30.8.2016
Changes	<ul style="list-style-type: none"> Added the password set-up guide (previously only in the AQivate 200 user guide).
Revision	1.04
Date	16.2.2017
Changes	<ul style="list-style-type: none"> Added the programmable control switch and the indicator object descriptions. Voltage regulator function description revised (added the curve scaling example). Programmable stage description added. Order code updated.
Revision	1.05

Date	14.8.2018
Changes	<ul style="list-style-type: none">Added the mA output option card description and updated the order code.

1.3 Safety information

This document contains important instructions that should be saved for future use. Read the document carefully before installing, operating, servicing, or maintaining this equipment. Please read and follow all the instructions carefully to prevent accidents, injury and damage to property.

Additionally, this document may contain four (4) types of special messages to call the reader's attention to useful information as follows:

NOTICE!

"Notice" messages indicate relevant factors and conditions to the the concept discussed in the text, as well as to other relevant advice.

CAUTION!

"Caution" messages indicate a potentially hazardous situation which, if not avoided, **could** result in minor or moderate personal injury, in equipment/property damage, or software corruption.

WARNING!

"Warning" messages indicate a potentially hazardous situation which, if not avoided, **could** result in death or serious personal injury as well as serious damage to equipment/property.

DANGER!

"Danger" messages indicate an imminently hazardous situation which, if not avoided, **will** result in death or serious personal injury.

These symbols are added throughout the document to ensure all users' personal safety and to avoid unintentional damage to the equipment or connected devices.

Please note that although these warnings relate to direct damage to personnel and/or equipment, it should be understood that operating damaged equipment may also lead to further, indirect damage to personnel and/or equipment. Therefore, we expect any user to fully comply with these special messages.

1.4 Abbreviations

AI	– Analog input
AR	– Auto-recloser
ASDU	– Application service data unit
AVR	– Automatic voltage regulator
BCD	– Binary-coded decimal
CB	– Circuit breaker
CBFP	– Circuit breaker failure protection
CLPU	– Cold load pick-up
CPU	– Central processing unit
CT	– Current transformer
CTM	– Current transformer module
CTS	– Current transformer supervision
DG	– Distributed generation
DHCP	– Dynamic Host Configuration Protocol
DI	– Digital input
DO	– Digital output
DOL	– Direct-on-line
DR	– Disturbance recorder
DT	– Definite time
FF	– Fundamental frequency
FFT	– Fast Fourier transform
FTP	– File Transfer Protocol
GI	– General interrogation
HMI	– Human-machine interface
HR	– Holding register
HV	– High voltage
HW	– Hardware
IDMT	– Inverse definite minimum time
IGBT	– Insulated-gate bipolar transistor

I/O – Input and output

IRIG-B – Inter-range instruction group, timecode B

LCD – Liquid-crystal display

LED – Light emitting diode

LV – Low voltage

NC – Normally closed

NO – Normally open

NTP – Network Time Protocol

RMS – Root mean square

RSTP – Rapid Spanning Tree Protocol

RTD – Resistance temperature detector

RTU – Remote terminal unit

SCADA – Supervisory control and data acquisition

SG – Setting group

SOTF – Switch-on-to-fault

SW – Software

THD – Total harmonic distortion

TRMS – True root mean square

VT – Voltage transformer

VTM – Voltage transformer module

VTS – Voltage transformer supervision

2 General

AQ-T216 transformer protection device is a member of the AQ 200 product line. The AQ 200 protection product line in respect of hardware and software is a modular concept. The hardware modules are assembled and configured according to the application IO requirements and the software determines the available functions. This manual describes the specific application of the AQ-T216 transformer protection device. For other AQ 200 and AQ 250 series products please consult their corresponding device manuals.

AQ-T216 is a transformer protection device with a sophisticated and easy-to-use differential protection function. The AQ-T216 transformer protection device provides both low-side and high-side overcurrent, earth fault, negative sequence and two independent restricted earth fault instances. AQ-T216 can be applied to generator and motor differential protection as well. There are up to two (2) option card slots available for additional I/O or communication cards for more comprehensive monitoring and control applications. AQ-T216 communicates using various protocols including the IEC 61850 substation communication standard.

3 Device user interface

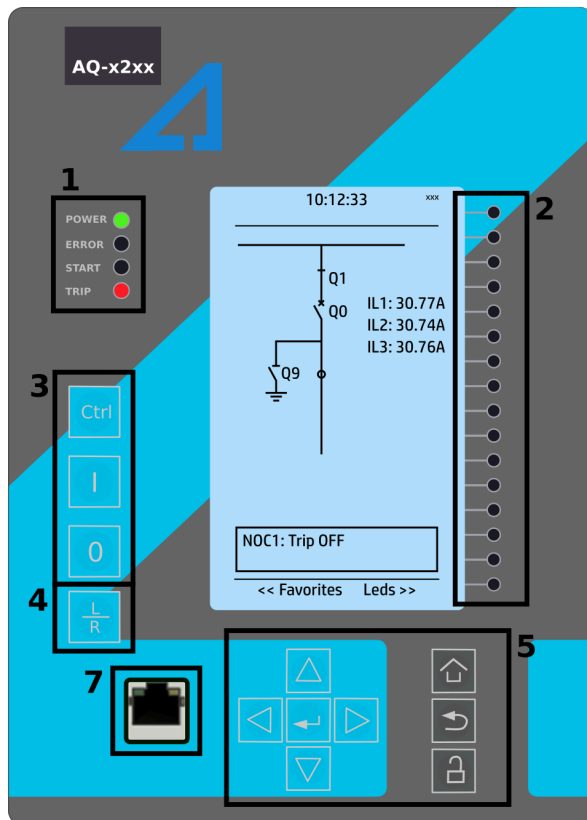

3.1 Panel structure

The user interface section of an AQ 200 or AQ 250 series device is divided into two user interface sections: one for the hardware and the other for the software. You can access the software interface either through the front panel or through the AQtivate 200 freeware software suite.

3.1.1 Local panel structure

The front panel of AQ 200 series devices have multiple LEDs, control buttons and a local RJ-45 Ethernet port for configuration. Each unit is also equipped with an RS-485 serial interface and an RJ-45 Ethernet interface on the back of the device.

Figure. 3.1.1 - 1. Local panel structure.

1. Four (4) default LEDs: "Power", "Error", "Start" (configurable) and "Trip" (configurable).
2. Sixteen (16) freely configurable LEDs with programmable legend texts.
3. Three (3) object control buttons: Choose the controllable object with the **Ctrl** button and control the breaker or other object with the **I** and **O** buttons.
4. The **L/R** button switches between the local and the remote control modes.
5. Eight (8) buttons for device local programming: the four navigation arrows and the **Enter** button in the middle, as well as the **Home**, the **Back** and the password activation buttons.
6. One (1) RJ-45 Ethernet port for device configuration.

When the unit is powered on, the green "Power" LED is lit. When the red "Error" LED is lit, the device has an internal (hardware or software) error that affects the operation of the unit. The activation of the yellow "Start" LED and the red "Trip" LED are based on the setting the user has put in place in the software.

The sixteen freely configurable LEDs are located on the right side of the display. Their activation and color (green or yellow) are based on the settings the user has put in place in the software.

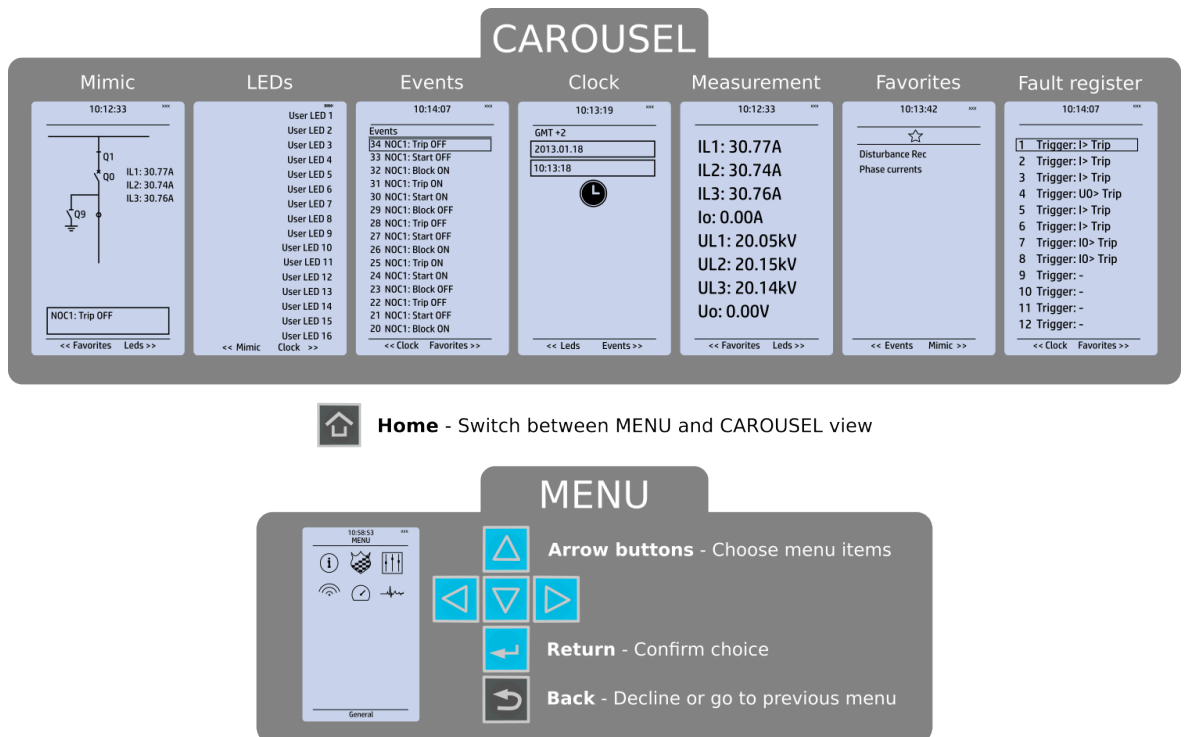

Holding the I (object control) button down for five seconds brings up the button test menu. It displays all the physical buttons on the front panel. Pressing any of the listed buttons marks them as tested. When all buttons are marked as having been tested, the device will return back to the default view.

3.2 Mimic and main menu

3.2.1 Basic configuration

The user interface is divided into seven (7) quick displays: "Mimic", "LEDs", "Events", "Clock", "Measurement", "Favorites" and "Fault register". The default quick display (as presented in the image below) is the mimic view; you can move through these menus by pressing the left and right arrow buttons. Please note that the available quick display carousel view might be different if you have changed the view with AQtivate's Carousel Designer tool.

Figure. 3.2.1 - 2. Basic navigation (general).

The **Home** button switches between the quick display carousel and the main display with the six (6) main configuration menus (*General, Protection, Control, Communication, Measurements and Monitoring*). Note that the available menus vary depending on the device type. You can select one of the menus by using the four navigation arrows and pressing **Enter** in the middle. The **Back** button takes you back one step. If you hold it down for three seconds, it takes you back to the main menu. You can also use it to reset the alarm LEDs you have set.

The password activation button (with the padlock icon) takes you to the password menu where you can enter the passwords for the various user levels (User, Operator, Configurator, and Super-user). See "[Configuring user levels and their passwords](#)" for more detail.

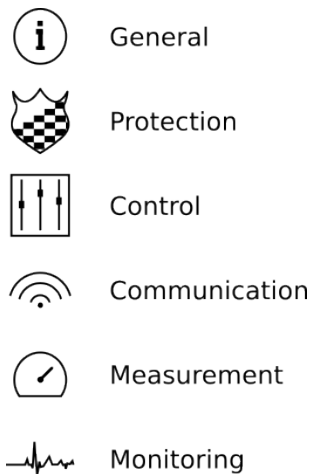

3.2.2 Navigation in the main configuration menus

All the settings in this device have been divided into the following six (6) main configuration menus:

- General
- Protection
- Control
- Communication
- Measurement
- Monitoring.

They are presented in the image below. The available menus vary according to the device type.

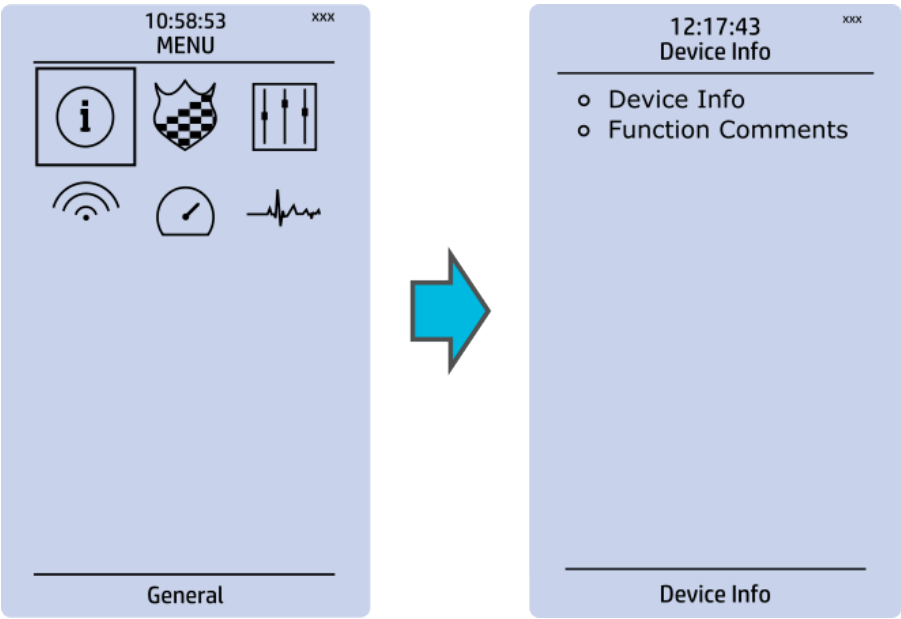

Figure. 3.2.2 - 3. Main configuration menus.

3.3 General menu

The *General* main menu is divided into two submenus: the *Device info* tab presents the information of the device, while the *Function comments* tab allows you to view all comments you have added to the functions.

Figure. 3.3 - 4. General menu structure.

Device info

Figure. 3.3 - 5. Device info.

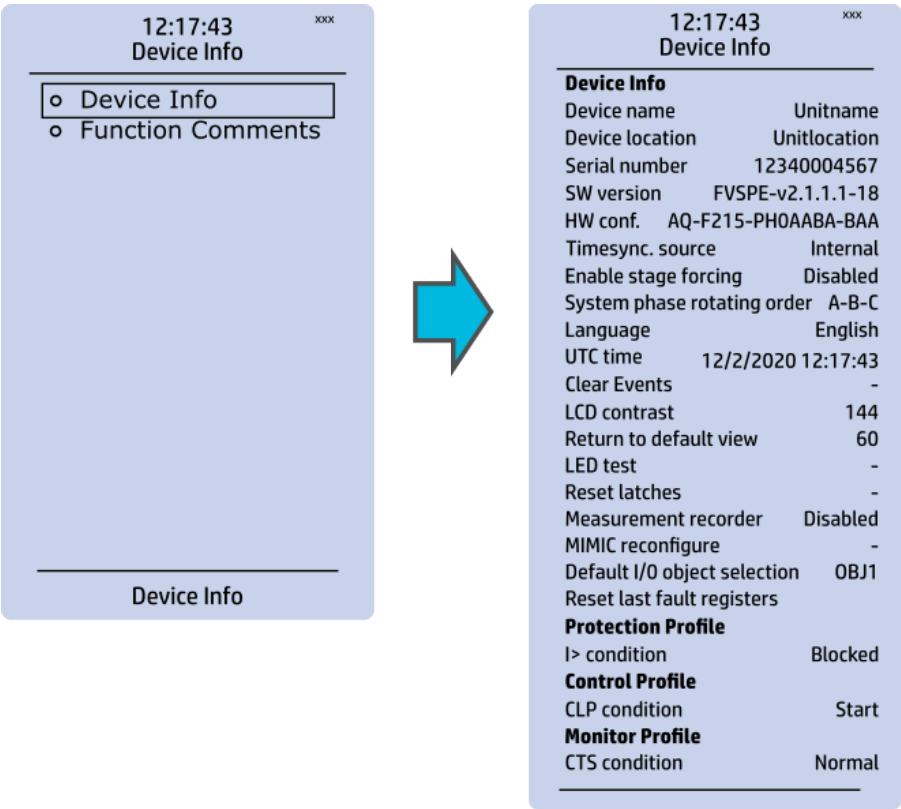

Table. 3.3 - 3. Parameters and indications in the *General* menu.

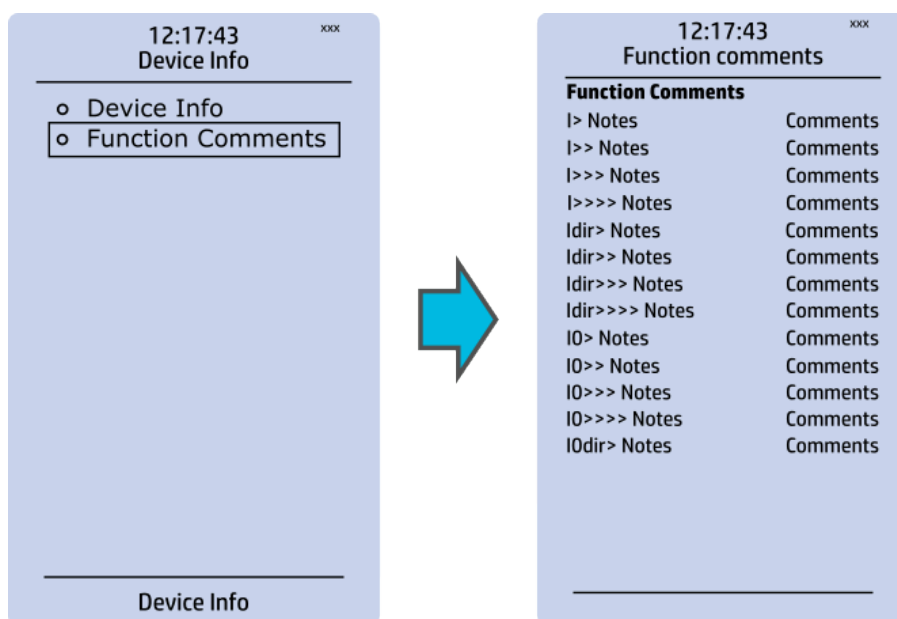

Name	Range	Step	Default	Description
Device name	-	-	Unitname	The file name uses these fields when loading the .aqs configuration file from the AQ-200 unit.
Device location	-	-	Unitlocation	
Serial number	-	-	-	Displays the unit's unique serial number. The serial number is also printed on the sticker located on the side of the unit.
Firmware version	-	-	-	Displays the software version (firmware) used by the unit. Upgradable by the user if a newer version is available.
Hardware configuration	-	-	-	Displays the hardware configuration of the unit. The hardware configuration is also printed on the sticker located on the side of the unit.
Time synchronization source	<ul style="list-style-type: none"> Internal External NTP External Serial IRIG-B 	-	<ul style="list-style-type: none"> Internal 	If an external clock time synchronization source is available, the type is defined with this parameter. In the internal mode there is no external Timesync source. IRIG-B requires a serial fiber communication option card.
Enable stage forcing	<ul style="list-style-type: none"> Disabled Enabled 	-	<ul style="list-style-type: none"> Disabled 	When this parameter is enabled it is possible for the user to force the protection, control and monitoring functions to different statuses like START and TRIP. This is done in the function's <i>Info</i> page with the <i>Force status to</i> parameter.
System phase rotating order	<ul style="list-style-type: none"> A-B-C A-C-B 	-	<ul style="list-style-type: none"> A-B-C 	Allows the user to switch the expected order in which the voltage and current phases are wired to the unit.
Language	<ul style="list-style-type: none"> User defined English Finnish Chinese Spanish French German Russian Ukrainian Kazakh 	-	<ul style="list-style-type: none"> English 	Changes the language of the parameter descriptions in the HMI. If the language has been set to "Other" in the settings of the AQtivate 200 setting tool, AQtivate follows the value set into this parameter.
UTC time	-	-	-	Displays the UTC time used by the unit without time zone corrections.
Clear events	<ul style="list-style-type: none"> - Clear 	-	<ul style="list-style-type: none"> - 	Clears the event history recorded in the device.
LCD Contrast	0...255	1	120	Changes the contrast of the LCD display.

Name	Range	Step	Default	Description
Return to default view	0...3600 s	10 s	0 s	If the user navigates to a menu and gives no input after a period of time defined with this parameter, the unit automatically returns to the default view. If set to 0 s, this feature is not in use.
LED test	<ul style="list-style-type: none"> - Activated 	-	<ul style="list-style-type: none"> - 	When activated, all LEDs are lit up. LEDs with multiple possible colors blink each color.
Reset latches	<ul style="list-style-type: none"> - Reset 	-	<ul style="list-style-type: none"> - 	Resets the latched signals in the logic and the matrix. When a reset command is given, the parameter automatically returns back to "-".
Measurement recorder	<ul style="list-style-type: none"> Disabled Enabled 	-	<ul style="list-style-type: none"> Disabled 	Enables the measurement recorder tool, further configured in <i>Tools</i> → <i>Misc</i> → <i>Measurement recorder</i> .
Reconfigure mimic	<ul style="list-style-type: none"> - Reconfigure 	-	<ul style="list-style-type: none"> - 	Reloads the mimic to the unit.
Reset last fault registers	-	-	-	Activation of input selected here resets the values in "Fault registers" view in carousel.
Protection/Control/Monitor profile	-	-	-	Displays the status of all enabled functions.

Function comments

Function comments displays notes of each function that has been activated in the Protection, Control and Monitoring menu. Function notes can be edited by the user.

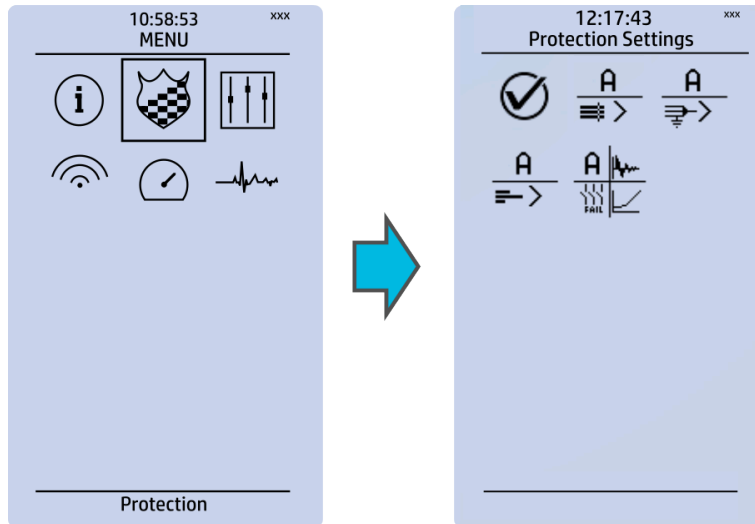

Figure. 3.3 - 6. Function comments.

3.4 Protection menu

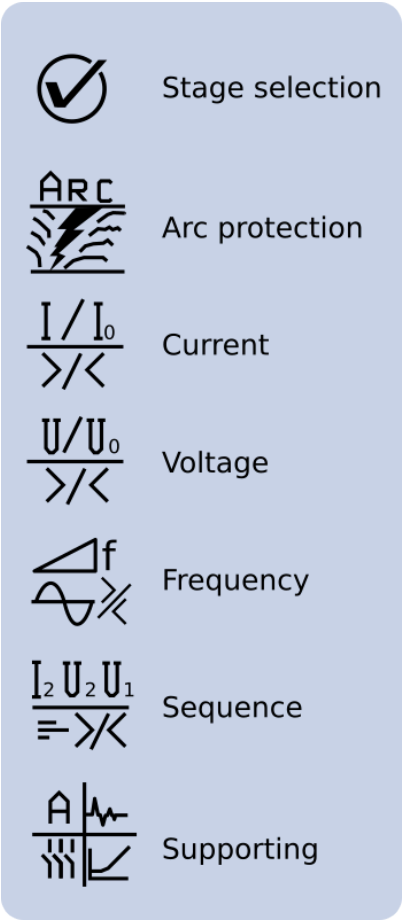

General

Figure. 3.4 - 7. Protection menu structure.

The *Protection* main menu includes the *Stage activation* submenu as well as the submenus for all the various protection functions, categorized under the following modules: "Arc protection", "Current", "Voltage", "Frequency", "Sequence" and "Supporting" (see the image below). The available functions depend on the device type in use.

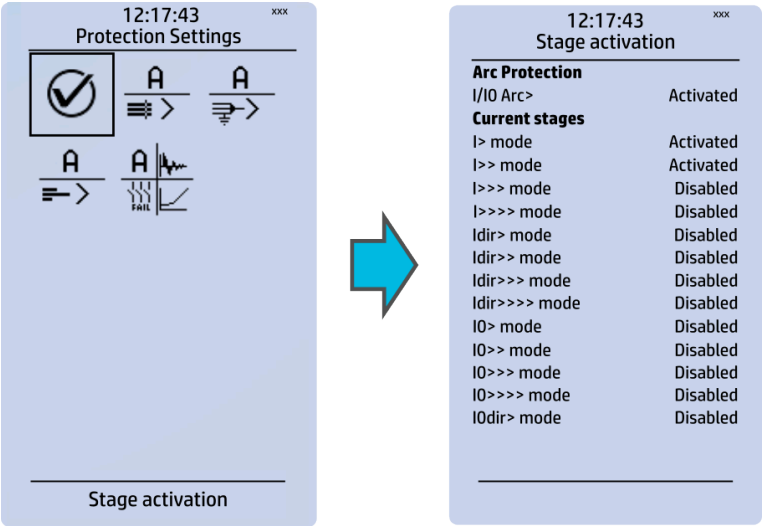

Figure. 3.4 - 8. Protection menu view.

Stage activation

You can activate the various protection stages in the *Stage activation* submenu (see the images below). Each protection stage and supporting function is disabled by default. When you activate one of the stages, its activated menu appears in the stage-specific submenu. For example, the I> (overcurrent) protection stage can be found in the "Current" module, whereas the U< (undervoltage) protection stage can be found in the "Voltage" module.

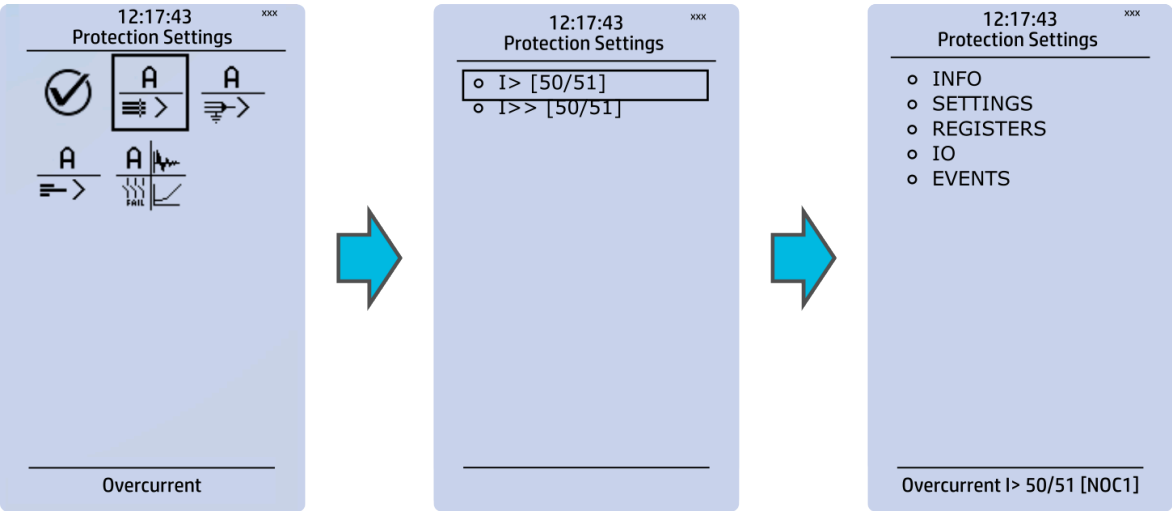

Figure. 3.4 - 9. Submenus for Stage activation.

Example of a protection stage and its use

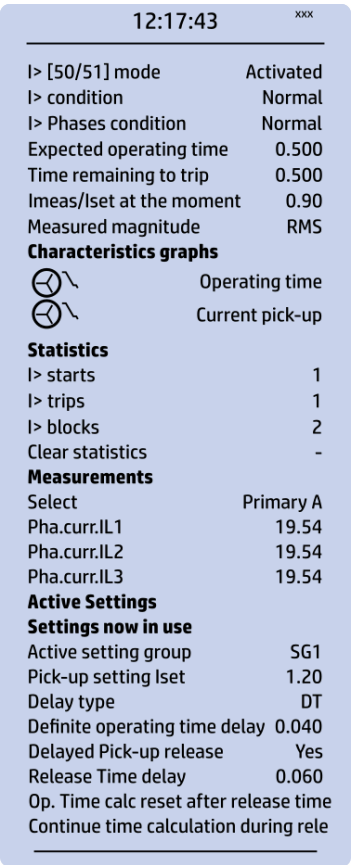

Once a protection stage has been activated in the *Stage activation* submenu, you can open its own submenu. In the image series below, the user has activated three current stages. The user accesses the list of activated current stages through the "Current" module, and selects the I> stage for further inspection.

Figure. 3.4 - 10. Accessing the submenu of an individual activated stage.

Each protection stage and supporting function has five sections in their stage submenus: "Info", "Settings", "Registers", "I/O" and "Events".

Figure. 3.4 - 11. Info.

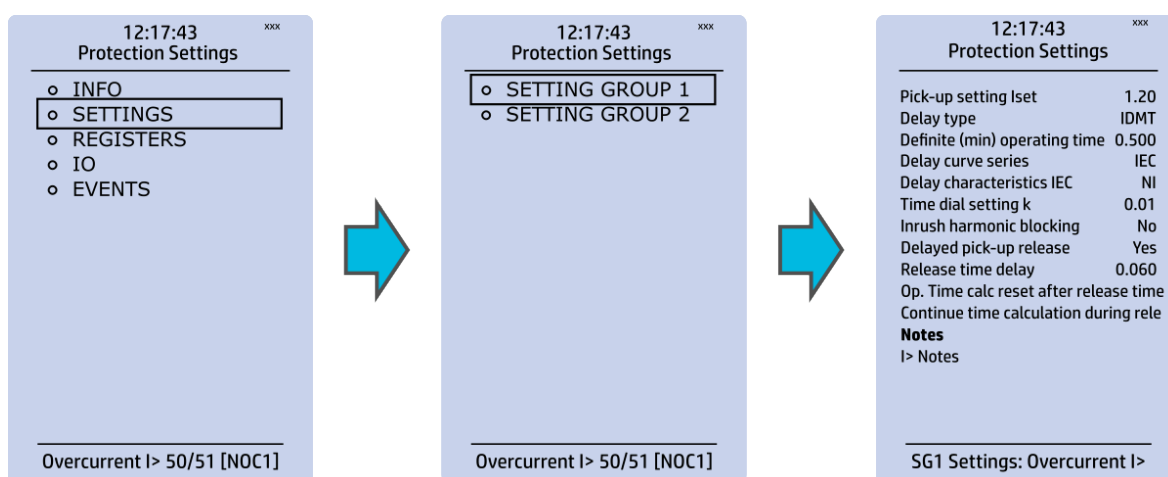

The "Info" section offers many details concerning the function and its status:

- Function condition: indicates the stage's condition which can be Normal, Start, Trip, or Blocked.
- Expected operating time: Expected time delay from detecting a fault to tripping the breaker. This value can vary during a fault if an inverse curve time delay (IDMT) is used.
- Time remaining to trip: When a fault is detected this value counts down towards zero. When zero is reached, the function will trip.
- Im_{meas}/I_{set} at the moment: Displays the ratio between the measured value and the pick-up level.
- Measured magnitude: In some functions it is possible to choose the monitored magnitude between Peak-to-peak, TRMS, or RMS (the default is RMS; the available magnitudes depend on the function).
- Characteristics graphs: opens graphs related to the protection function.
- Statistics: indicates the number of function starts, trips and blocks (can be cleared through "Clear statistics" → "Clear").
- Measurements: displays the measurements carried out by the function.
- Active settings: displays the setting group that is currently in use and its settings (other setting groups can be set in the "Settings" section).

While the function is activated and disabled in the *Stage activation* submenu, you can disable the function through the "Info" section ("Function mode" at the top of the section).

Figure. 3.4 - 12. Settings.

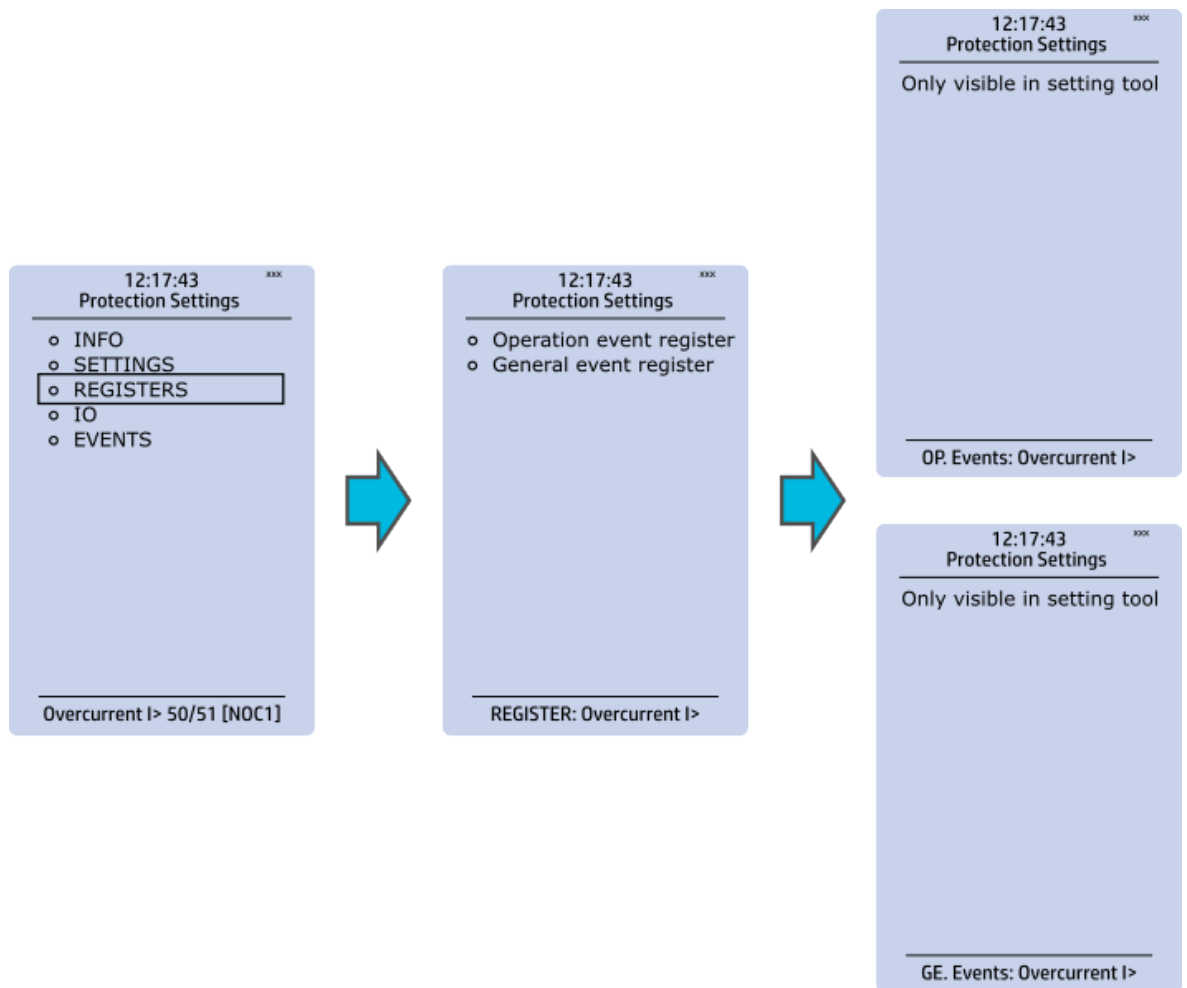

The stage settings vary depending on which protection function they are a part of. By default only one setting group of the eight available setting groups is activated. You can enable more groups in the *Control* → *Setting groups* menu, although they are set here in the "Settings" section.

Most protection functions follow the same structure:

- Pick-up setting: Defines the fault magnitude. Most functions pick-up value is in relation to the current transformer or voltage transformer nominal, but some functions use kW, ohm, Hz and other units. Voltage and current transformers nominal values can be set at *Measurement* → *Transformers*.
- Delay type and operating time delay settings are described in detail in [General properties of a protection function](#) chapter.

Figure. 3.4 - 13. Registers.

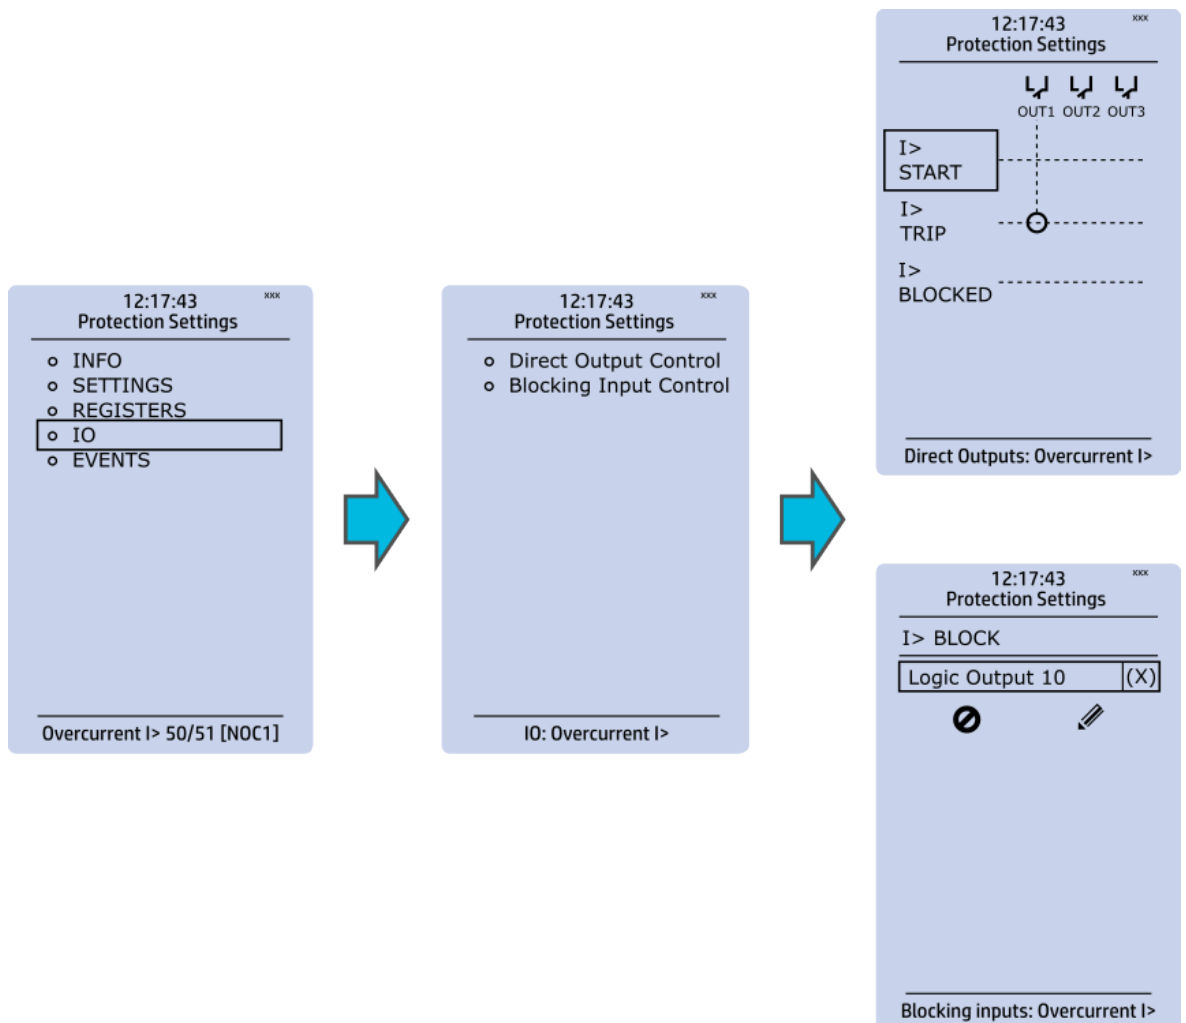

Register menu content is not available in the HMI. It can only be accessed with AQtivate setting tool. Stored in the "Registers" section you can find both "Operation event register" and "General event register".

"Operation event register" stores the function's specific fault data. There are twelve (12) registers, and each of them includes data like the pre-fault value, the fault value, the time stamp and the active group during the trigger. Data included in the register depend on the protection function. You can clear the the operation register by choosing "Clear registers" → "Clear".

"General event register" stores the event generated by the stage. These general event registers cannot be cleared.

Figure. 3.4 - 14. I/O.

The "I/O" section is divided into two subsections: "Direct output control" and "Blocking input control".

In "Direct output control" you can connect the stage's signals to physical outputs, either to an output relay or an LED (START or TRIP LEDs or one of the 16 user configurable LEDs). If the stage is blocked internally (DI or another signal), you can configure an output to indicate the stage that is blocked. A connection to an output can be either latched ("|x|") or non-latched ("x").

"Blocking input control" allows you to block stages. The blocking can be done by using any of the following:

- digital inputs
- logical inputs or outputs
- the START, TRIP or BLOCKED information of another protection stage
- object status information.

Figure. 3.4 - 15. Events.

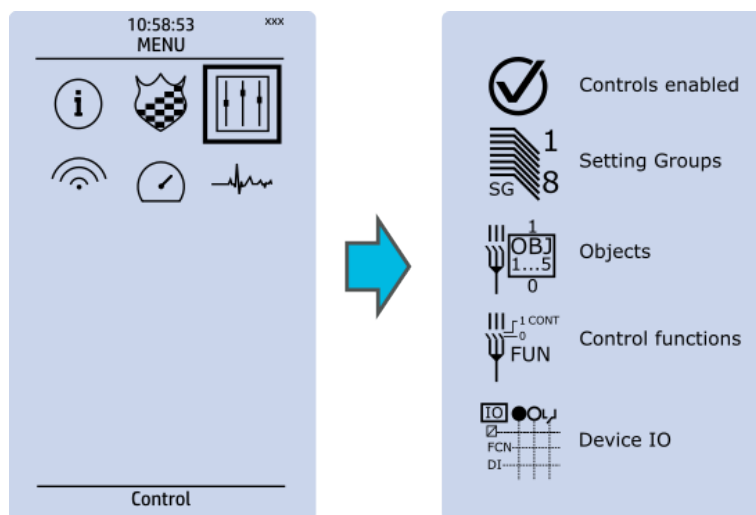

You can mask on and mask off the protection stage related events in "Event mask". By default events are masked off. You can activate the desired events by masking them ("x"). Remember to save your maskings by confirming the changes with the check mark icon. If you want to cancel the changes, select the strike-through circle to do so. Only masked events are recorded to event history (which can be accessed in the "Events" view in the user view section).

3.5 Control menu

Main menu

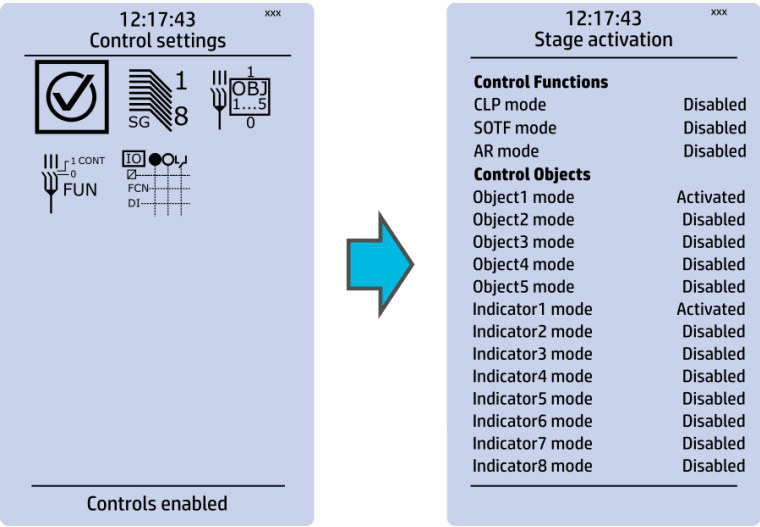

Figure. 3.5 - 16. Main menu structure.

The *Control* main menu includes submenus (see the image above) for enabling the various control functions and objects (*Controls enabled*), for enabling and controlling the setting groups (*Setting groups*), for configuring the objects (*Objects*), for setting the various control functions (*Control functions*), and for configuring the inputs and outputs (*Device I/O*). The available control functions depend on the model of the device in use.

Controls enabled

Figure. 3.5 - 17. Controls enabled submenu.

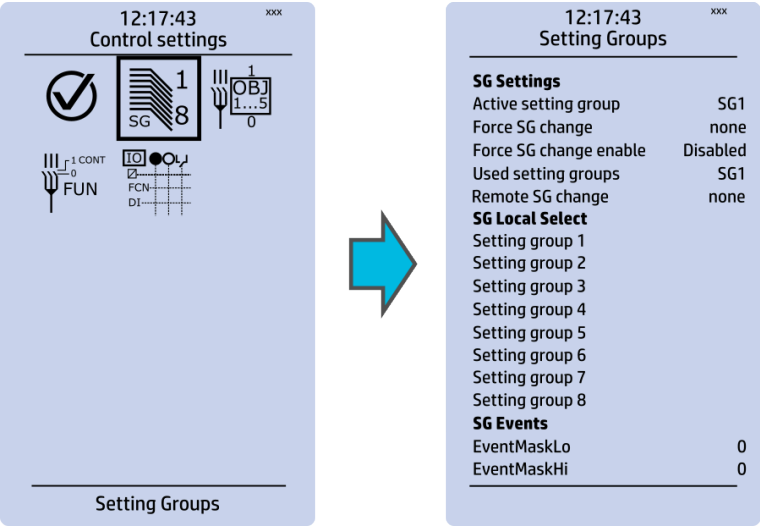

You can activate the selected control functions in the *Controls enabled* submenu. By default all the control functions are disabled. All activated functions can be viewed in the *Control functions* submenu (see the section "Control functions" below for more information).

In this submenu you can also activate and disable controllable objects. As with control functions, all objects are disabled by default. All activated objects can be viewed in the *Objects* submenu (see the section "Objects" below for more information).

Setting groups

Figure. 3.5 - 18. Setting groups submenu.

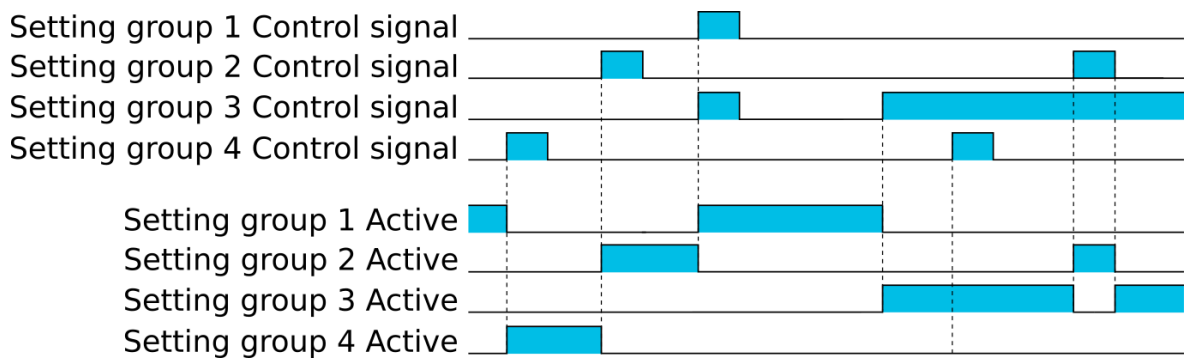

The *Setting groups* submenu displays all the information related to setting group changing, such as the following:

- **Active setting group:** displays the current active setting group (SG1...SG8).
- **Force setting group change:** this setting allows the activation of a setting group at will (please note that Force SG change enable must be "Enabled").

- **Used setting groups:** this setting allows the activation of setting groups SG1...SG8 (only one group is active by default).
- **SG local select:** selects the local control for the different setting groups (can use digital inputs, logical inputs or outputs, RTDs, object status information as well as stage starts, trips or blocks).
- **Remote setting group change:** When enabled it is possible to change the setting group manually through SCADA.
- **SG events:** event masking for setting groups (masks are OFF by default; please note that only masked events are recorded into the event history).

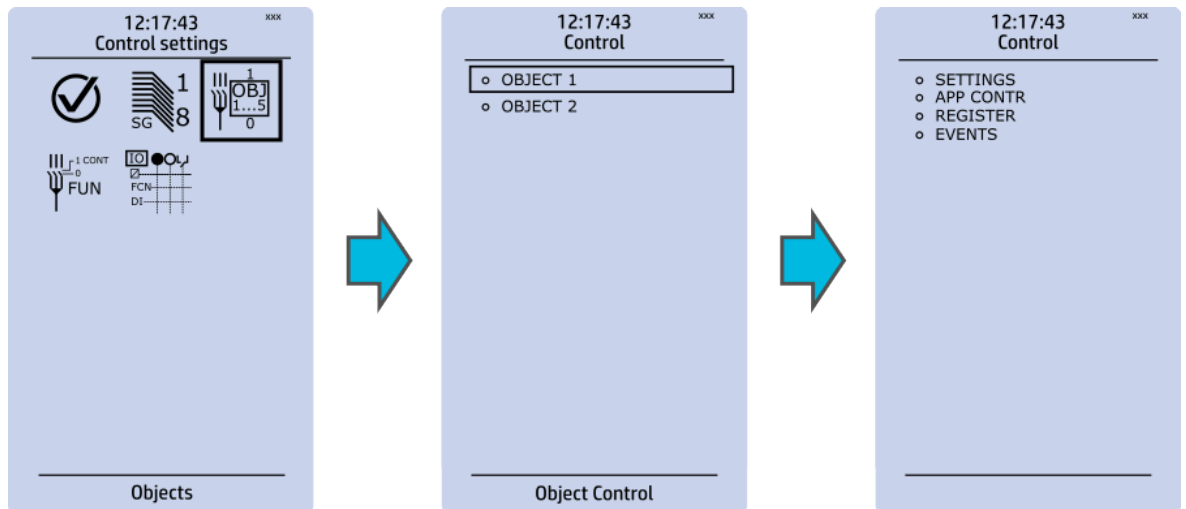

Setting group 1 (SG1) has the highest priority, while Setting group 8 (SG8) has the lowest priority. Setting groups can be controlled with pulses or with both pulses and static signals (see the image below).

Figure. 3.5 - 19. Example of setting group (SG) changing.

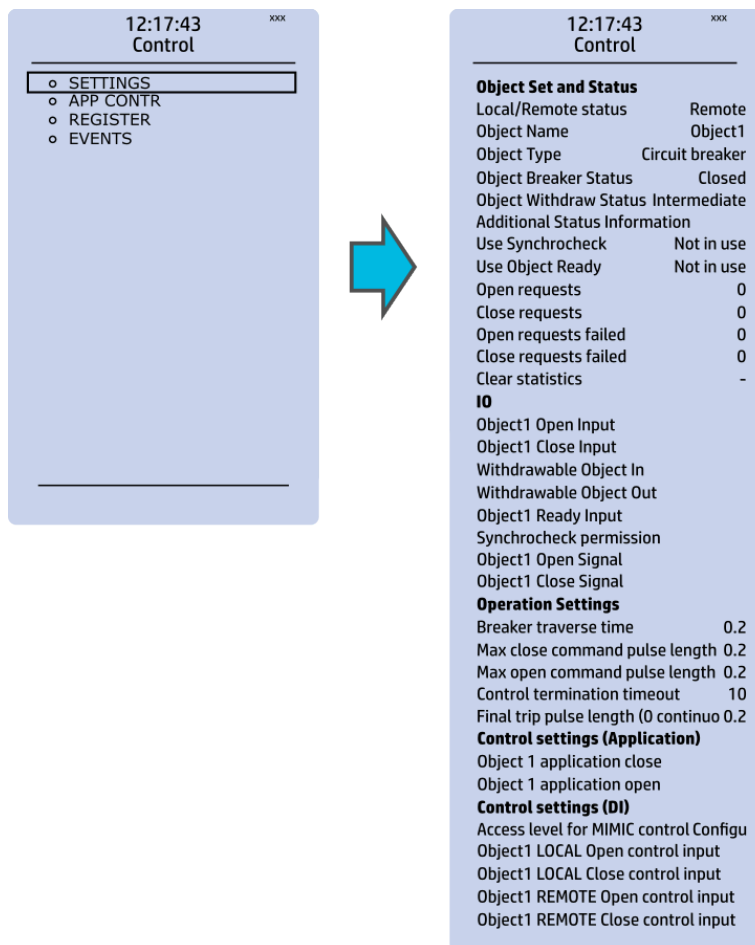

Objects

Figure. 3.5 - 20. Objects submenu.

Each activated object is visible in the *Objects* submenu. By default all objects are disabled unless specifically activated in the *Controls* → *Controls enabled* submenu. Each active object has four sections in their submenus: "Settings", "Application control" ("App contr"), "Registers" and "Events". These are described in further detail below.

Figure. 3.5 - 21. Settings section.

OBJECT SET AND STATUS

- **Local/Remote status:** control access may be set to Local or Remote (Local by default; please note that when local control is enabled, the object cannot be controlled through the bus and vice versa).
- **Object name:** the name of the object (objects are named "ObjectX" by default).
- **Object type:** selects the type of the object from Grounding disconnector, Motor-controlled disconnector, Circuit breaker and Withdrawable circuit breaker (Circuit breaker by default).
- **Object x status:** the status can be Bad, Closed, Open and Intermediate. The status "Intermediate" is the phase between "Open" and "Closed" where both status inputs are 0. The status "Bad" occurs when both status inputs of the object/cart are 1.
- **Additional status information:** gives feedback from the object on whether the opening and closing are allowed or blocked, whether the object is ready, and whether the synchronization status is ok.
- **Use synchrocheck and Use Object ready:** closing the object is forbidden when the sides are not synchronized or when the object is not ready to be closed.
- **Open requests and Close requests:** displays the statistics, i.e. the number of Open and Close requests.
- **Open requests failed and Close requests failed:** displays the statistics of Open and Close request failures. A request is considered to have failed when the object does not change its status as a result of that request.
- **Clear statistics:** statistics can be cleared by choosing "Clear statistics" and then "Clear".

I/O

- An object has both **Open input** and **Close input** signals which are used for indicating the status of the breaker on the HMI and in SCADA. Status can be indicated by any of the following: digital inputs, logical inputs or outputs.
- A withdrawable object has both **In** and **Out** inputs. The status can be indicated by any of the following: digital inputs, logical inputs or outputs.
- Both **Object ready** and **Synchrocheck permission** have status inputs. If either one is used, the input(s) must be active for the device to be able to give the "Object Close" command.
- **Object open** and **Object close** signals define which digital output is controlled.

OPERATION SETTINGS

- **Breaker traverse time:** determines how long a gap there can be between a status change from "Open" to "Closed" before an intermediate status is reported by the function.
- **Max close/open command pulse length:** defines the maximum length of "Open" and "Close" commands. If the status has changed before the maximum pulse length has elapsed, the pulse is cut short.
- **Control termination timeout:** If the status of the object does not change during the set time, an "Open/Close request failed" event is recorded.
- After the set delay, if the controlled object does not respond accordingly, the procedure is terminated and a fail message is issued.

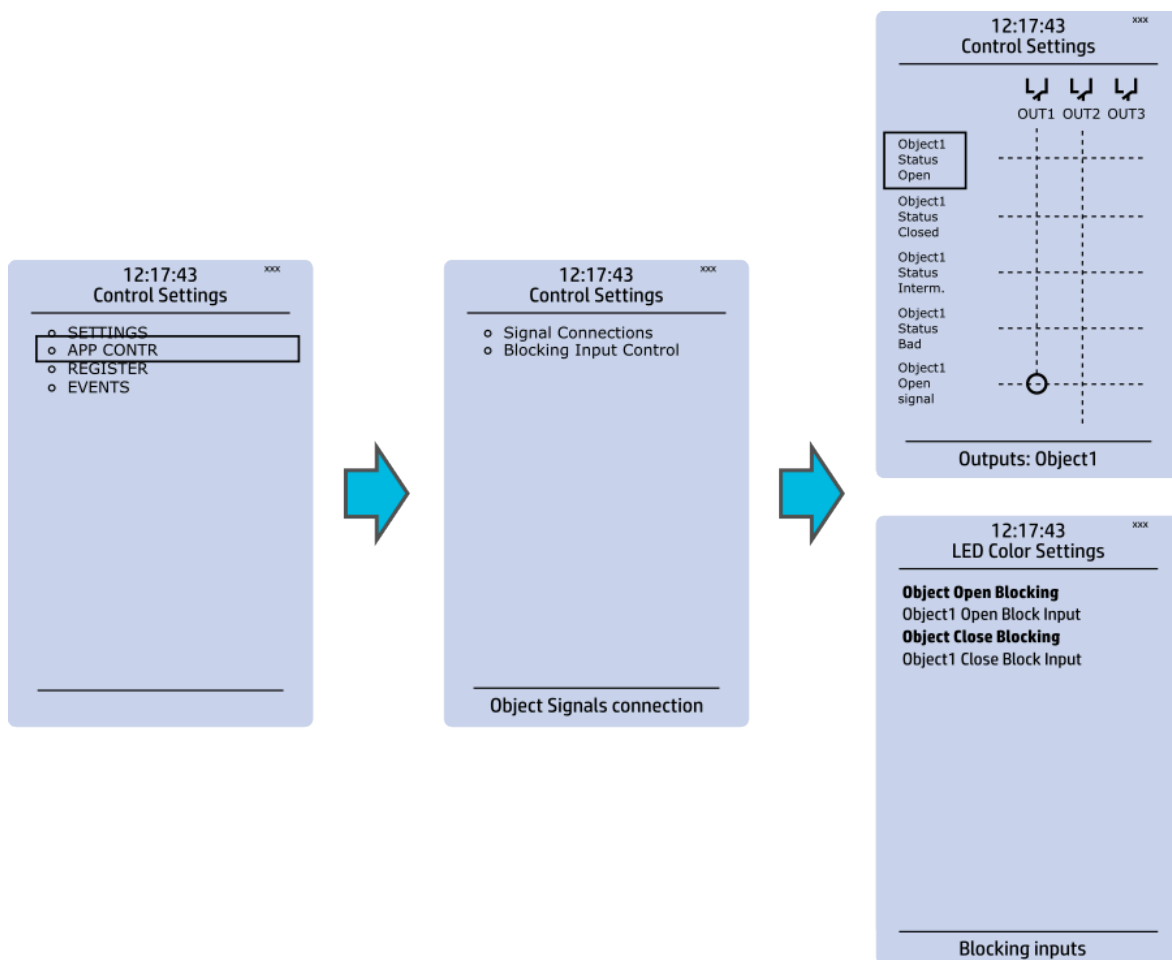

CONTROL SETTINGS (APPLICATION)

- **Object application close** and **Object application open:** a signal set to these points can be used to open and close the object. Controlling the object through this point does not follow the local/remote status of the device.

CONTROL SETTINGS (DI)

- **Access level for MIMIC control:** determines the access level required to control the MIMIC (each level has its own password). By default, the access level is set to "Configurator".
- You can use digital inputs to control the object locally or remotely. Remote controlling via the bus is configured on the protocol level.

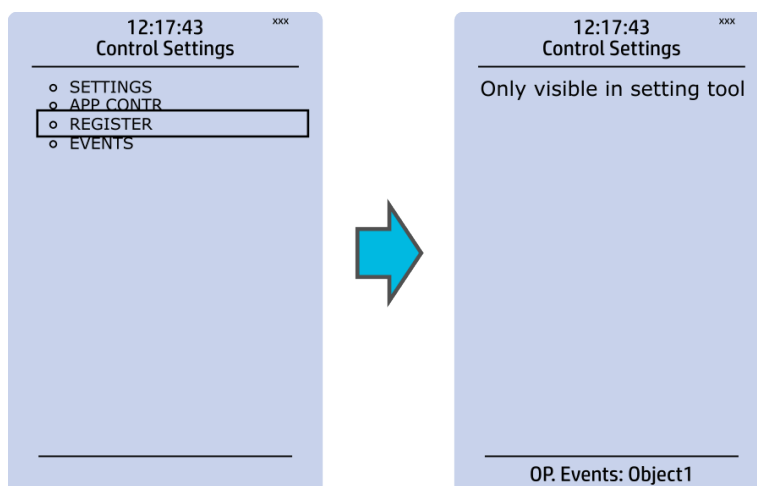

Figure. 3.5 - 22. Application control section.

You can connect object statuses directly to specific physical outputs in the "Signal connections" subsection (*Control* → *Application control*). A status can be connected to output relays, as well as to user-configurable LEDs. A connection to an output can be either latched ("|x|") or non-latched ("x").

Object blocking is done in the "Blocking input control" subsection. It can be done by any of the following: digital inputs, logical inputs or outputs, object status information as well as stage starts, trips or blocks.

Figure. 3.5 - 23. Registers section.

The "Registers" section stores the function's specific fault data. There are twelve (12) registers, and each of them includes data such as opening and closing times, command types and request failures. The data included in the register depend on the protection function. You can clear the the operation register by choosing "Clear registers" → "Clear".

Please note that the content of the *Registers* section is not available in the HMI. It can only be accessed via the AQtivate setting tool.

Figure. 3.5 - 24. Events section.

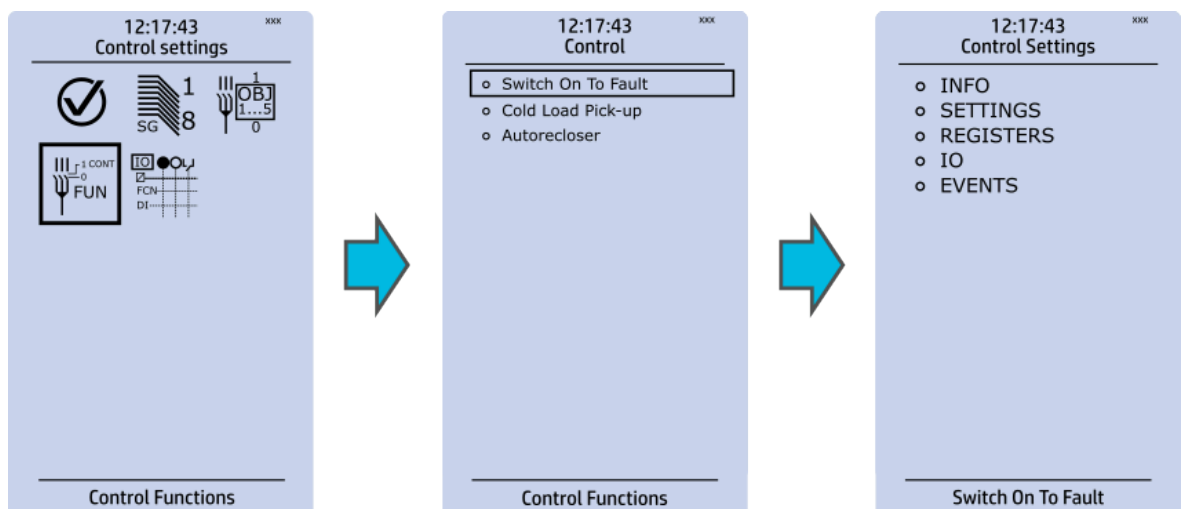

You can mask on and mask off events related to an object's stage in "Event mask". By default all events are masked off. You can activate the desired events by masking them ("x"). Please remember to save your maskings by confirming the changes with the check mark icon. If you want to cancel the changes, select the strike-through circle to do so. Only masked events are recorded to the event history (which can be accessed in the "Events" view in the user view section).

Control functions

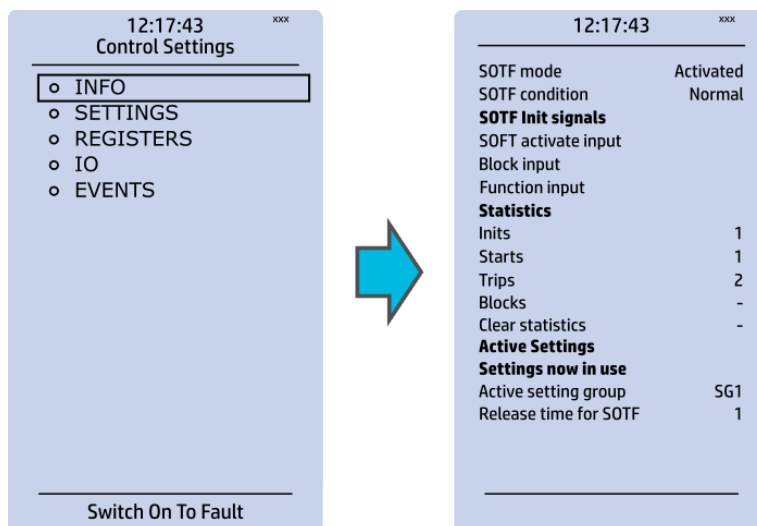

Once a control function has been activated in the *Controls* → *Controls enabled* submenu, its own submenu can be opened. In the image series below, the user has activated three control functions. The user accesses the list of activated control stages through the "Control functions" module, and selects the control function for further inspection.

Figure. 3.5 - 25. Control functions submenu.

Each control function that has been activated is listed in the *Control functions* submenu (see the middle image above). This submenu includes the following sections: "Info", "Settings", "Registers", "I/O" and "Events". The text below describes these in further detail.

Figure. 3.5 - 26. Info section.

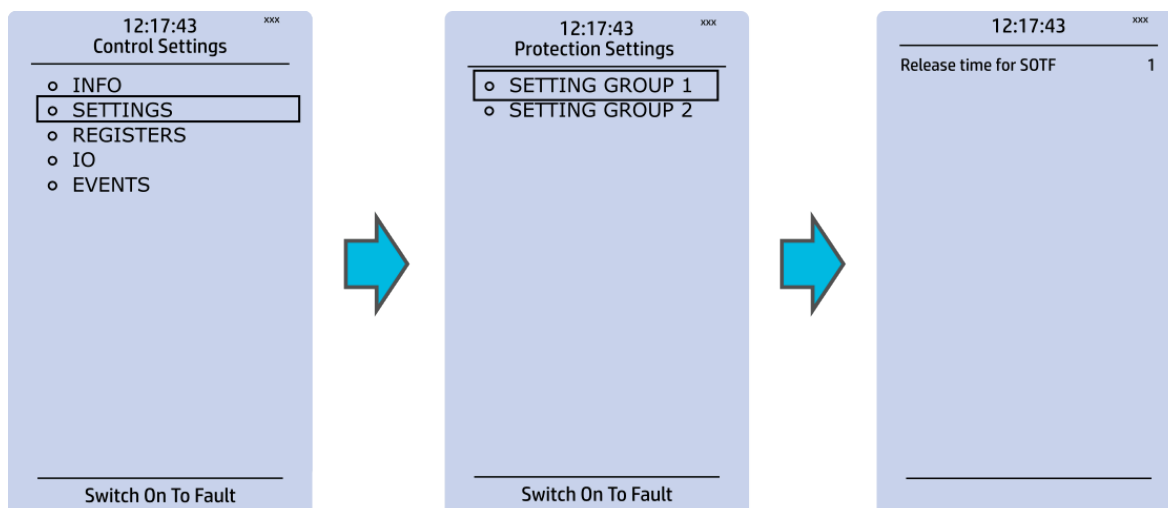

The "Info" section offers many details concerning the function and its status:

- **Function condition:** indicates the stage's condition which can be Normal, Start, Trip, or Blocked.
- **Measured magnitude:** In some functions it is possible to choose the monitored magnitude between Peak-to-peak, TRMS, or RMS (the default is RMS; the available magnitudes depend on the function).
- **Statistics:** indicates the number of function starts, trips and blocks (can be cleared through "Clear statistics" → "Clear").
- **Measurements:** displays the measurements carried out by the function.
- **Active settings:** displays the setting group that is currently in use and its settings (other setting groups can be set in the "Settings" section).

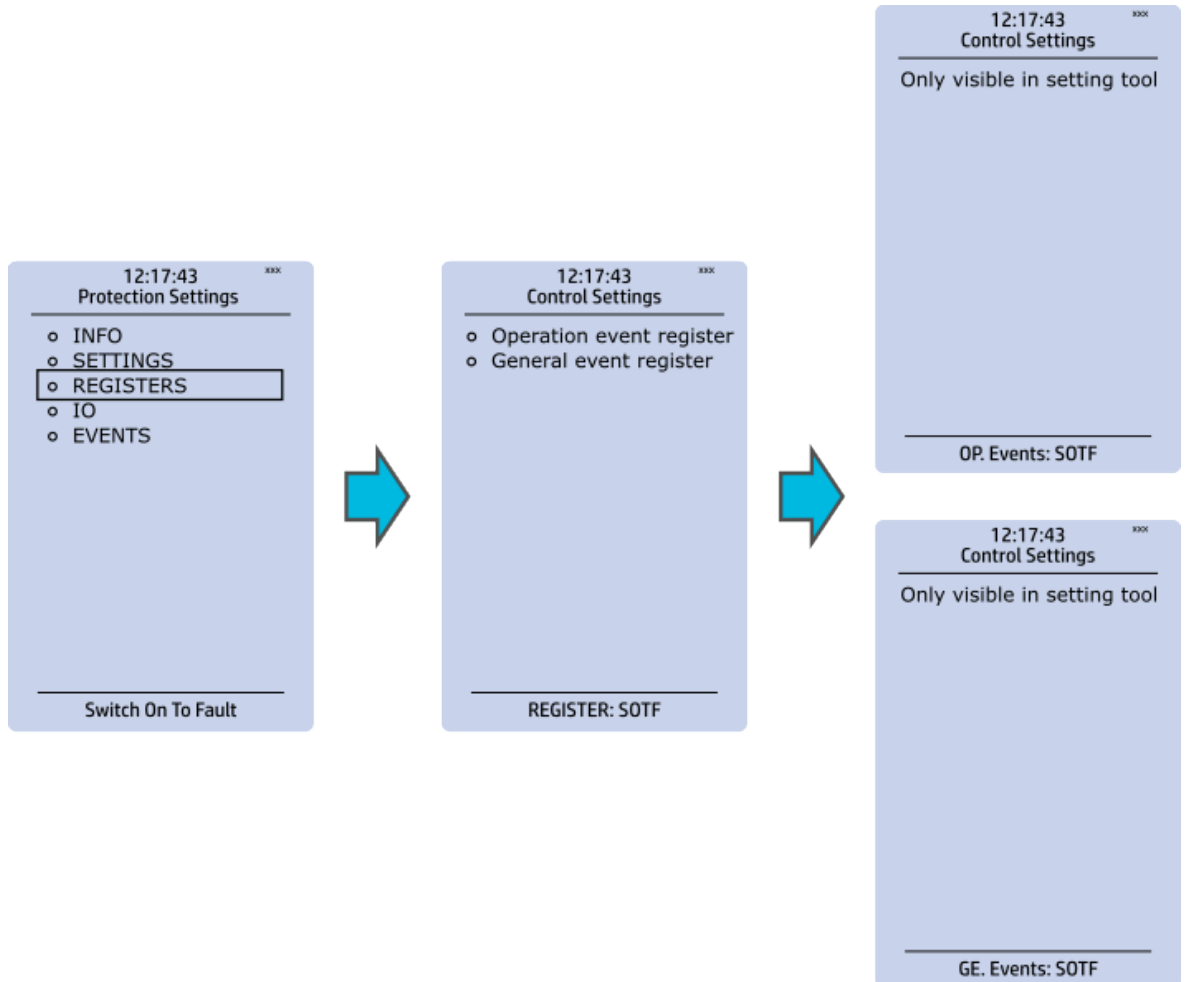

While the function is activated and disabled in the *Control* → *Controls enabled* submenu, you can disable the function through the "Info" section (the [function name] mode at the top of the section).

Figure. 3.5 - 27. Settings section.

The stage settings vary depending on which control function they are a part of. By default only one setting group of the eight available setting groups is activated. You can enable more groups in the *Control → Setting groups* menu, although they are set here in the "Settings" section.

Figure. 3.5 - 28. Registers section.

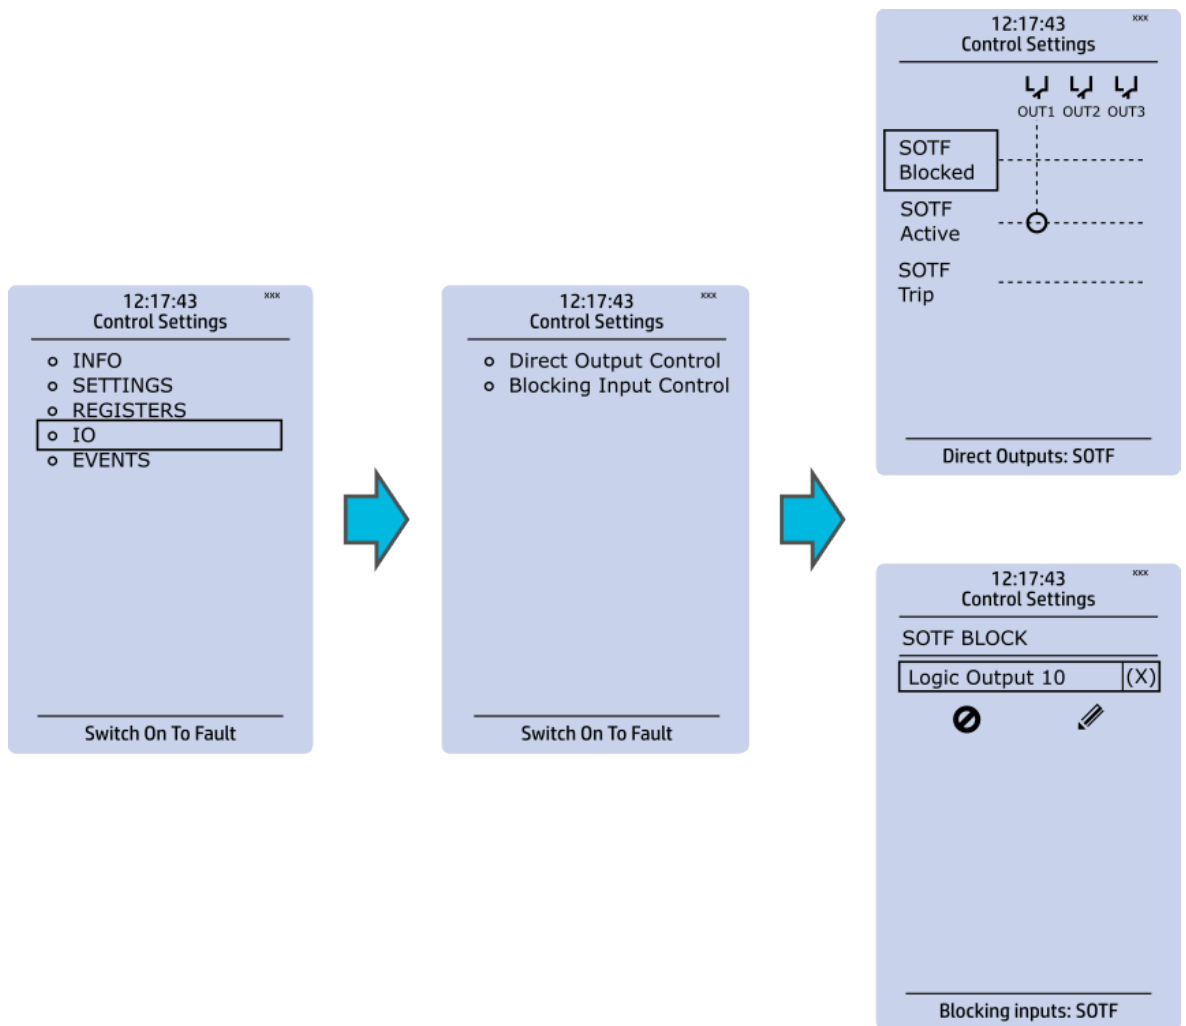

Please note that the content of the "Registers" section is not available in the HMI. It can only be accessed via the AQtivate setting tool. Stored in the "Registers" section you can find both "Operation event register" and "General event register".

"Operation event register" stores the function's specific operation data. There are twelve (12) registers, and each of them includes data like the pre-fault value, the fault value, the time stamp and the active group during the trigger. Data included in the register depend on the control function. You can clear the the operation register by choosing "Clear registers" → "Clear".

"General event register" stores the event generated by the stage. These general event registers cannot be cleared.

Figure. 3.5 - 29. I/O section.

The "I/O" section is divided into two subsections: "Direct output control" and "Blocking input control".

In "Direct output control" you can connect the stage's signals to physical outputs, either to an output relay or an LED (START or TRIP LEDs or one of the 16 user configurable LEDs). If the stage is blocked internally (by a digital input or another signal), you can configure an output to indicate the stage that is blocked. A connection to an output can be either latched ("X") or non-latched ("x").

"Blocking input control" allows you to block stages. The blocking can be done by using any of the following:

- digital inputs.
- logical inputs or outputs.
- the START, TRIP or BLOCKED information of another protection stage.
- object status information.

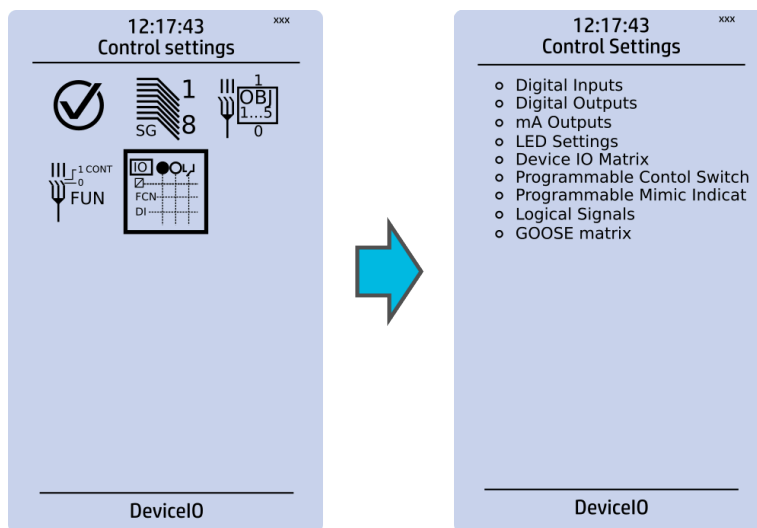

Figure. 3.5 - 30. Events section.

You can mask on and mask off events related to an object's stage in "Event mask". By default all events are masked off. You can activate the desired events by masking them ("x"). Please remember to save your maskings by confirming the changes with the check mark icon. If you want to cancel the changes, select the strike-through circle to do so. Only masked events are recorded to the event history (which can be accessed in the "Events" view in the user view section).

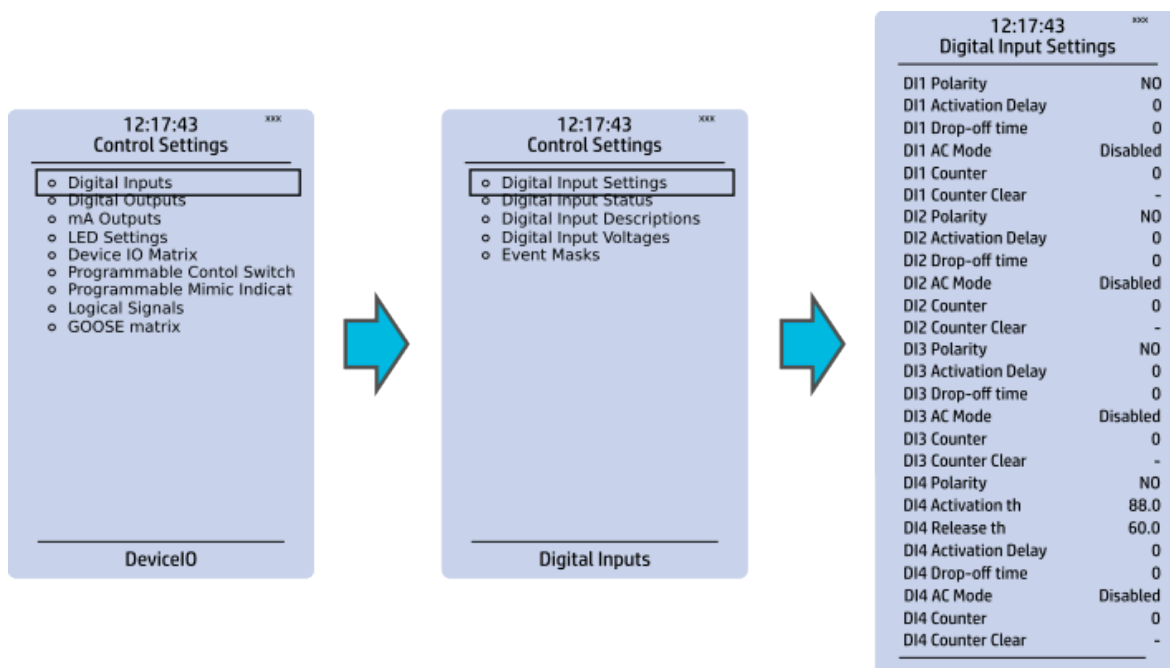

Device I/O

Figure. 3.5 - 31. Device I/O submenu.

The *Device I/O* submenu is divided into the following nine sections: "Digital inputs", "Digital outputs", "mA Outputs", "LED settings", "Device I/O matrix", "Programmable control switch", "Programmable Mimic Indicator", "Logic signals" and "GOOSE matrix". Please note that digital inputs, logic outputs, protection stage status signals (START, TRIP, BLOCKED, etc.) as well as object status signals can be connected to an output relay or to LEDs in the "Device I/O matrix" section.

Figure. 3.5 - 32. Digital input section.

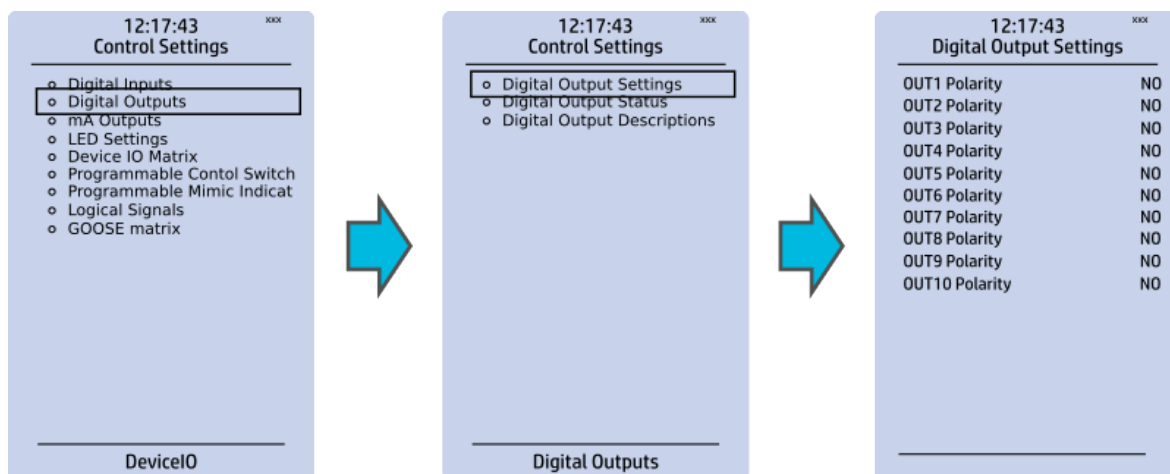

All settings related to digital inputs can be found in the "Digital inputs" section.

The "Digital inputs settings" subsection includes various settings for the inputs: the polarity selection determines whether the input is Normal Open (NO) or Normal Closed (NC) as well as the activation threshold voltage (16...200 V AC/DC, step 0.1 V) and release threshold voltage (10...200 V AC/DC, step 0.1 V) for each available input. There is also a setting to determine the wanted activation and release delay (0...1800 s, step 1 ms). Digital input activation and release threshold follow the measured peak value. The activation time of an input is 5...10 ms. The release time with DC is 5...10 ms, while with AC it is less than 25 ms. The first three digital inputs don't have activation and release threshold voltage settings as these have already been defined when the unit was ordered.

Digital input statuses can be checked from the corresponding subsection ("Digital input status"). The "Digital input descriptions" subsection displays the texts the user has written for each digital input. In the "Event masks" subsection you can determine which events are masked –and therefore recorded into the event history– and which are not.

Figure. 3.5 - 33. Digital outputs section.

All settings related to digital outputs can be found in the "Digital outputs" section.

The "Digital outputs settings" subsection lets you select the polarity for each output; they can be either Normal Open (NO) or Normal Closed (NC). The default polarity is Normal Open. The operational delay of an output contact is approximately 5 ms. You can view the digital output statuses in the corresponding subsection ("Digital output status"). The "Digital output descriptions" subsection allows you to configure the description text for each output. All name changes affect the matrices as well as input–output selection lists.

NOTICE!

An NC signal goes to the default position (NO) if the device loses the auxiliary voltage or if the system is fully reset. However, an NC signal does not open during voltage or during System full reset. An NC output signal does not open during a Communication or Protection reset.

Figure. 3.5 - 34. LED settings section.

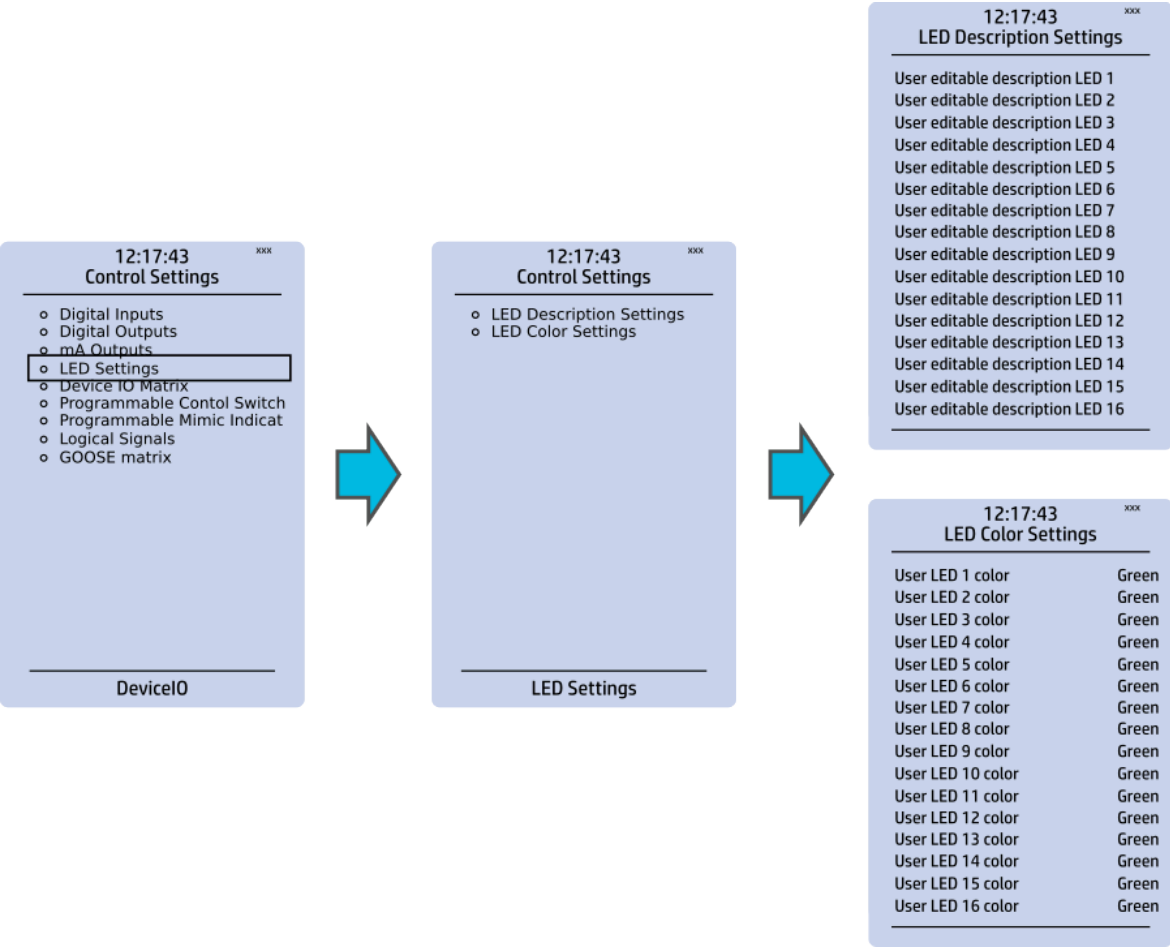

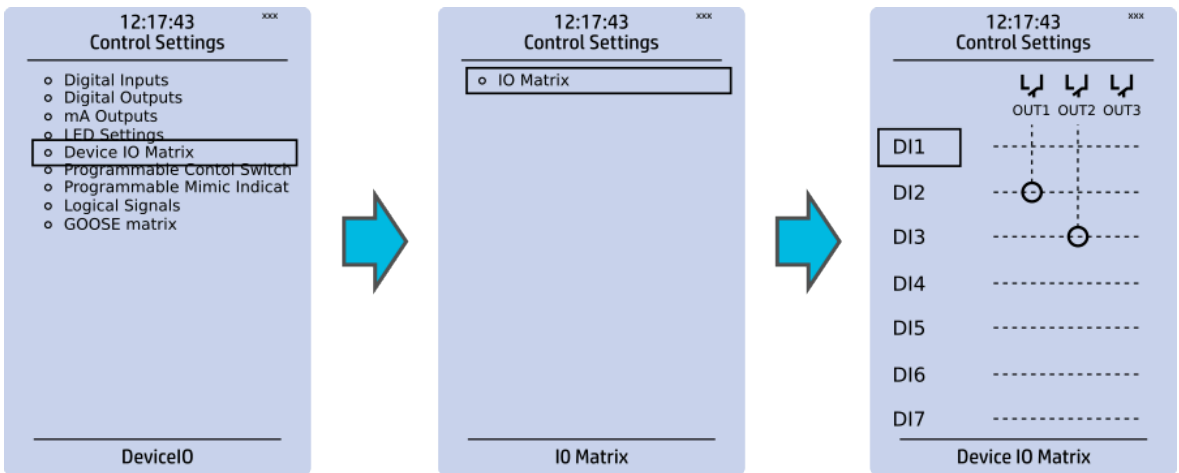

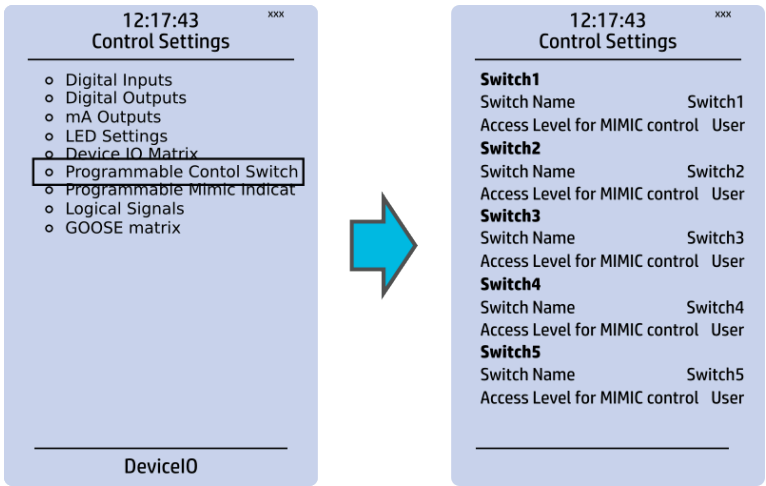

Figure. 3.5 - 35. Device I/O matrix section.

Through the "Device I/O matrix" section you can connect digital inputs, logical outputs, protection stage status signals (START, TRIP, BLOCKED, etc.), object status signals and many other binary signals to output relays, or to LEDs configured by the used. A connection can be latched ("|x|") or non-latched ("x"). Please note that a non-latched output is deactivated immediately when the triggering signal is disabled, while a latched signal stays active until the triggering signal deactivates and the latched function is manually cleared.

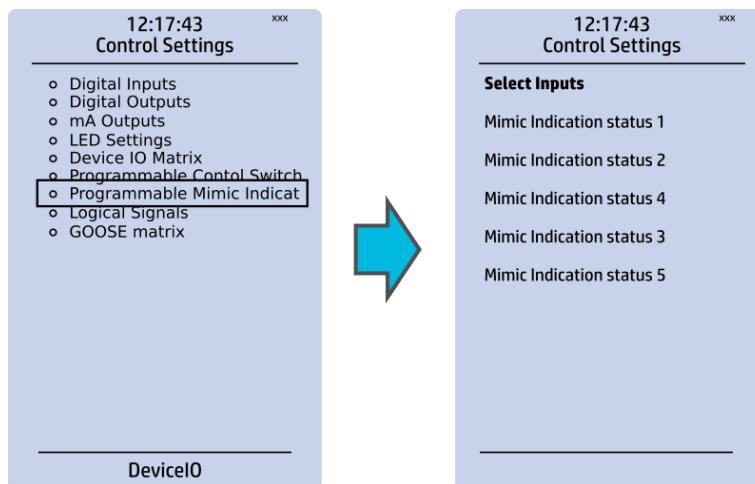

You can clear latched signals by entering the mimic display and the pressing the **Back** button on the panel.

Figure. 3.5 - 36. Programmable control switch section.

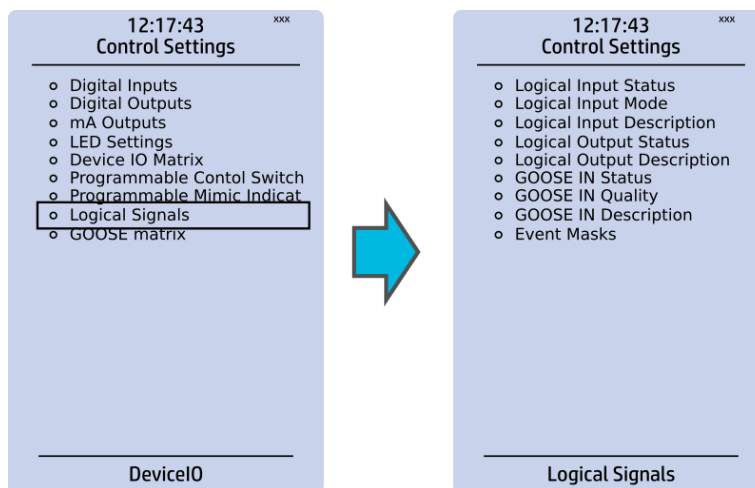

Programmable control switches (PCSs) are switches that can be used to control signals while in the mimic view. These signals can be used in a variety of situations, such as for controlling the logic program, for function blocking, etc. You can name each switch and set the access level to determine who can control the switch.

Figure. 3.5 - 37. Programmable mimic indicators section.

Programmable mimic indicators can be placed into the mimic to display a text based on the status of a given binary signal (digital input, logical signal, status of function start/tripped/blocked signals etc.). When configuring the mimic with the AQtivate 200 setting tool, it is possible to set a text to be shown when an input signal is ON and a separate text for when the signal is OFF.

Figure. 3.5 - 38. Logical signals section.

All AQ 200 series units have the following types of logical signals:

- 32 logical input signal status bits; the status of a bit is either 0 or 1.
- 32 logical output signal status bits; the status of a bit is either 0 or 1.
- 64 GOOSE input signal status bits; the status of a bit is either 0 or 1.
- 64 quality bits for GOOSE input signals; the status of a bit is either 0 or 1.

Logical input signals can be used when building a logic with the AQtivate 200 setting tool. The status of a logical input signal can be changed either from the mimic or through SCADA. By default logical inputs use "Hold" mode in which the status changes from 0 to 1 and from 1 to 0 only through user input. The mode of each input can be changed to "Pulse" in which a logical input's status changes from 0 to 1 through user input and then immediately back to 0.

Logical output signals can be used as the end result of a logic that has been built in the AQtivate 200 setting tool. The end result can then be connected to a digital output or a LED in the matrix, block functions and much more.

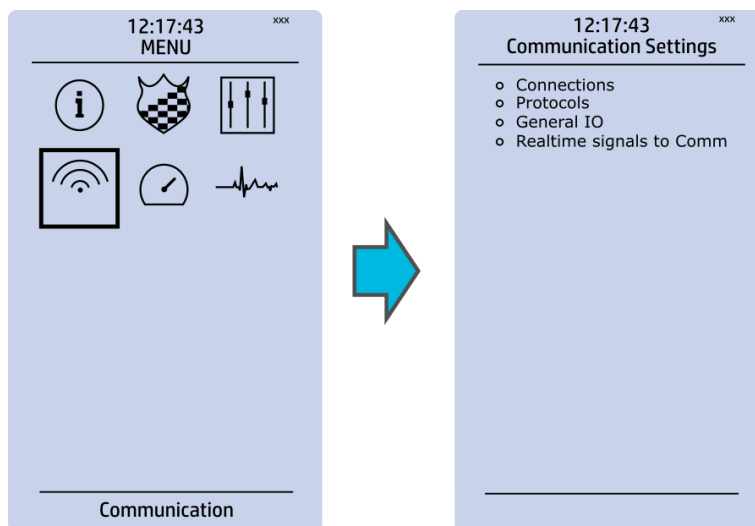

GOOSE inputs are mainly used for controlling purposes and in conjunction with the IEC 61850 communication protocol. There are 64 GOOSE inputs signal status bits, and their status can be either 0 or 1. "GOOSE IN quality" checks the quality of a GOOSE input message. There are 64 GOOSE input quality signals, and their status can be either 0 ("Good" or "Valid") or 1 ("Bad" or "Invalid"). Logical outputs can be used when building a programmable logic. Activating a logic gate does not create an event but when a logical output is connected to a logic gate it is possible to create an event from the gate's activation. All logical inputs and outputs have both ON and OFF events, and they can be masked on when necessary (they are masked off by default).

**NOTICE!**

Please refer to the "[Communication](#)" chapter for a more detailed description of the use of logical signals.

3.6 Communication menu

Figure. 3.6 - 39. Communication menu.

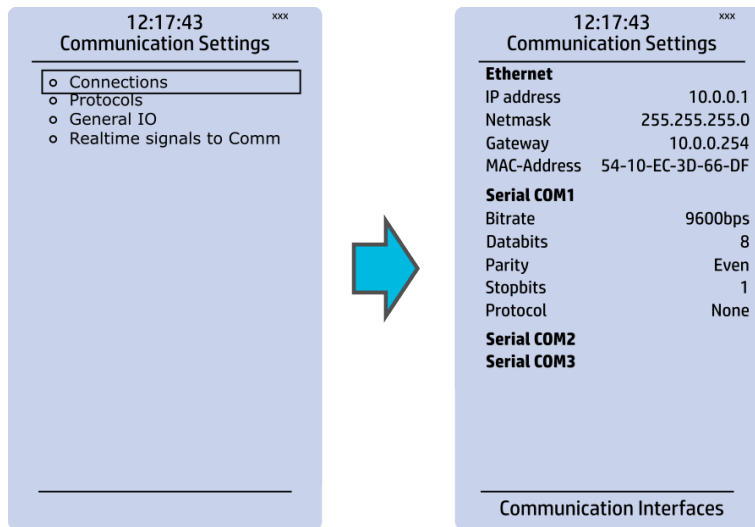

The *Communication* main menu includes four submenus (as seen in the figure above): *Connections*, *Protocols*, *General IO* and *Realtime signals to Comm*. All devices can be configured through the Ethernet connection in the back panel with the AQtivate 200 setting tool software. Connecting to AQtivate requires knowing the IP address of your device: this can be found in the *Communication* → *Connections* submenu. As a standard, the devices support the following communication protocols:

- NTP
- IEC 61850
- Modbus/TCP
- Modbus/RTU
- IEC-103
- IEC -101/104
- SPA
- DNP3
- ModbusIO.

Connections

Figure. 3.6 - 40. View of the Connections submenu.

The *Connections* submenu offers the following bits of information and settings:

ETHERNET

This section defines the IP settings for the Ethernet port in the back panel of the unit.

- IP address: the IP address of the device which can be set by the user (the default IP address depends on the device).
- Network: the network subnet mask is entered here.
- Gateway: the gateway is configured only when communicating with devices in a separate subnet.
- MAC-Address: The unique MAC address of the device, which is **not** configurable by the user.

SERIAL COM

This section defines the basic settings of the RS-485 port in the back panel of the unit.

- Bitrate: displays the bitrate of the RS-485 serial communication interface (9600 bps as standard, although it can be changed to 19,200 bps or to 38,400 bps if an external device supports the faster speed).
- Databits, Parity and Stopbits: these can be set according to the connected external devices.
- Protocol: by default the device does not have any serial protocol activated, although IEC 103, Modbus I/O and Modbus/RTU can be used for communication.

NOTICE!

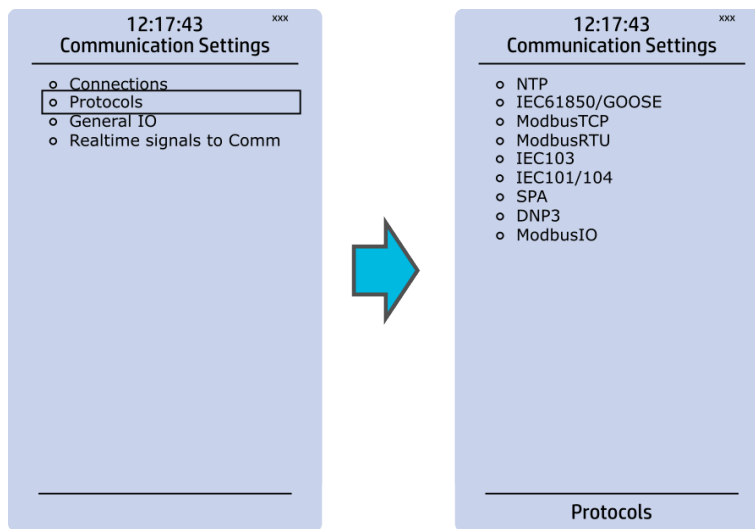

When communicating with a device via the front Ethernet port connection, the IP address is always 192.168.66.9.

SERIAL COM1 & COM2

SERIAL COM1 and SERIAL COM2 are reserved for serial communication option cards. They have the same settings as the RS-485 port.

Protocols

Figure. 3.6 - 41. View of the Protocols submenu.

The *Protocols* submenu offers access to the various communication protocol configuration menus. Some of the communication protocols use serial communication and some use Ethernet communication. Serial communication protocols can be used either with the RS-485 port that is in AQ 200 series units by default, or with a serial communication option card. Ethernet communication protocols can be used either with the RJ-45 port in the back of the unit or with an Ethernet communication option card.

The communication protocols are:

- NTP: this protocol is used for time synchronization over Ethernet, and can be used simultaneously with Ethernet-based communication protocols.
- IEC 61850: an Ethernet-based communication protocol.
- Modbus/TCP: an Ethernet-based communication protocol.
- Modbus/RTU: a serial communication protocol.
- IEC-103: a serial communication protocol.
- IEC-101/104: since the standards IEC 60870-5-101 and IEC 60870-5-104 are closely related, the IEC-101 protocol uses serial communication on the physical layer, whereas the IEC-104 protocol uses Ethernet communication.
- SPA: a serial communication protocol.
- DNP3: supports both serial and Ethernet communication.
- ModbusIO: used for connecting external devices like ADAM RTD measurement units.

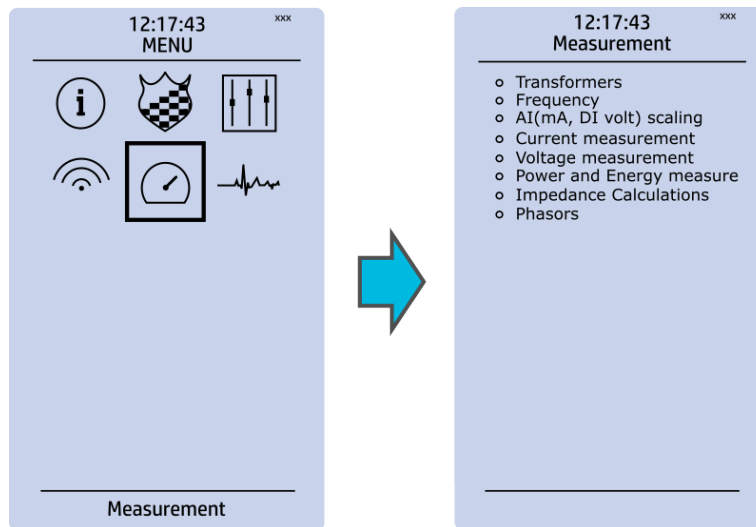

NOTICE!

Please refer to the "[Communication](#)" chapter for a more detailed text on the various communication options.

3.7 Measurement menu

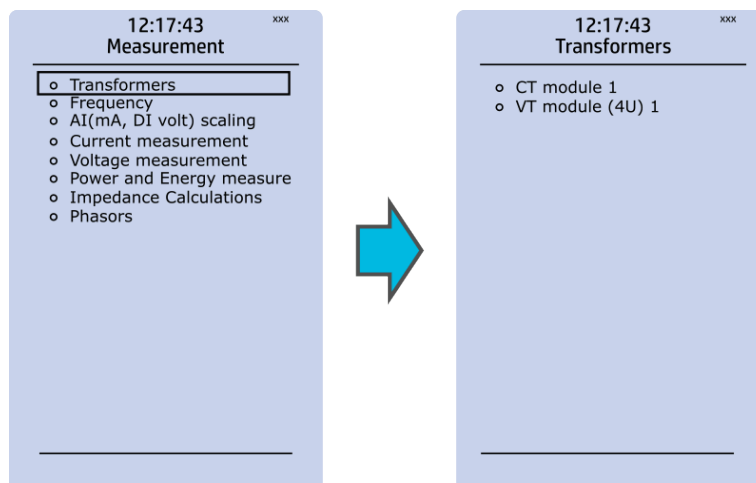

Figure. 3.7 - 42. Measurement section.

The *Measurement* menu includes the following submenus: *Transformers*, *Frequency*, *Current measurement*, *Voltage measurement*, *Power and energy measurement*, *Impedance calculations*, and *Phasors*. The available measurement submenus depends on the type of device in use. The ratio used by the current and voltage transformers is defined in the *Transformers* submenu, while the system nominal frequency is specified in the *Frequency* submenu. Other submenus are mainly for monitoring purposes.

Transformers

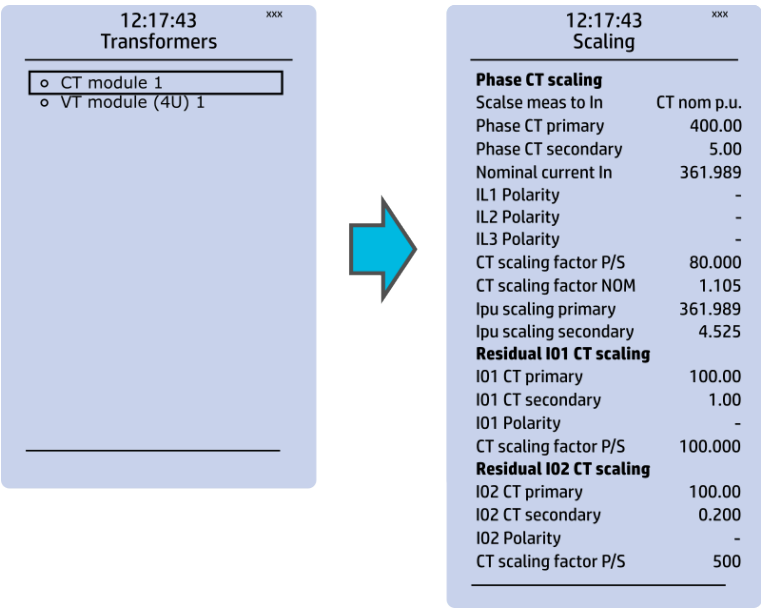

Figure. 3.7 - 43. Transformers section.

Transformers menu is used for setting up the measurement settings of available current transformer modules or voltage transformer modules. Some unit types have more than one CT or VT module. Some unit types like AQ-S214 do not have current or voltage transformers at all.

CT module

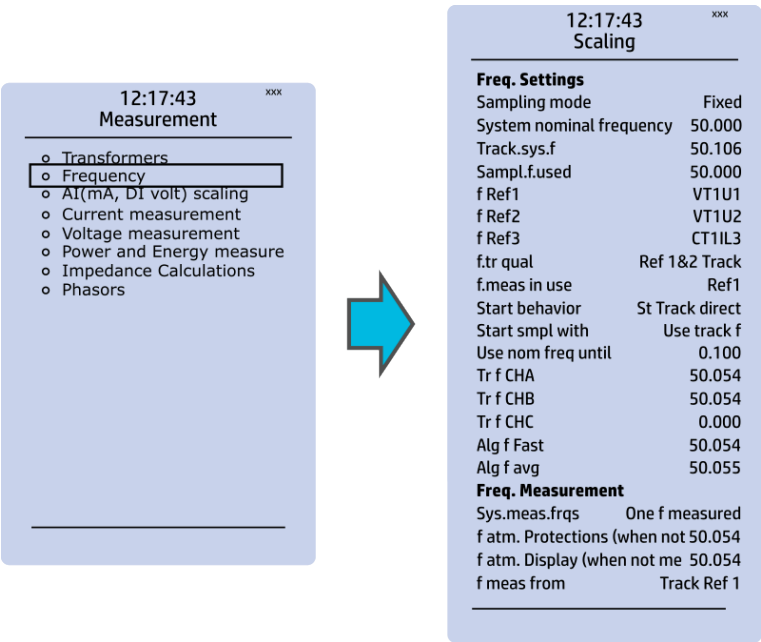

Figure. 3.7 - 44. CT module section.

The three main sections ("Phase CT scaling", "Residual I01 CT scaling" and "Residual I02 CT scaling") determine the ratio of the used transformers. Additionally, the nominal values are also determined in the *CT module* submenu. Sometimes a mistake in the wiring can cause the polarity to be changed; in such cases, you can invert the polarity of each phase current individually. The *CT module* submenu also displays additional information such as CT scaling factors and per-unit scaling factors.

Frequency

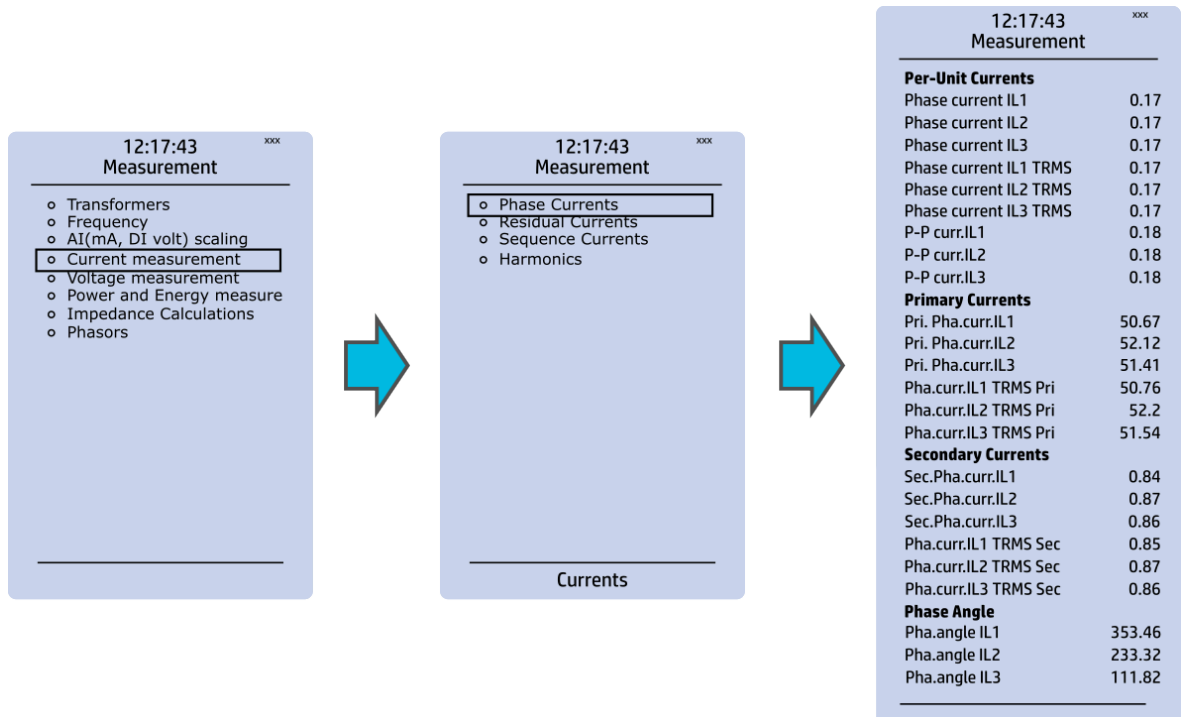

Figure. 3.7 - 45. Frequency submenu.

Frequency measurements use the fixed sampling mode as the default, and "System nominal frequency" should be set to the desired level. When "Sampling mode" is set to "Tracking", the device uses the measured frequency value as the system nominal frequency. There are three frequency reference channels: f Ref1, fRef2 and fRef3. With these parameters it is possible to set up three voltage or current channels to be used for frequency sampling. Parameter "f.meas in use" indicates which of the three channels are used for sampling if any.

Current measurement

Figure. 3.7 - 46. Current measurement submenu.

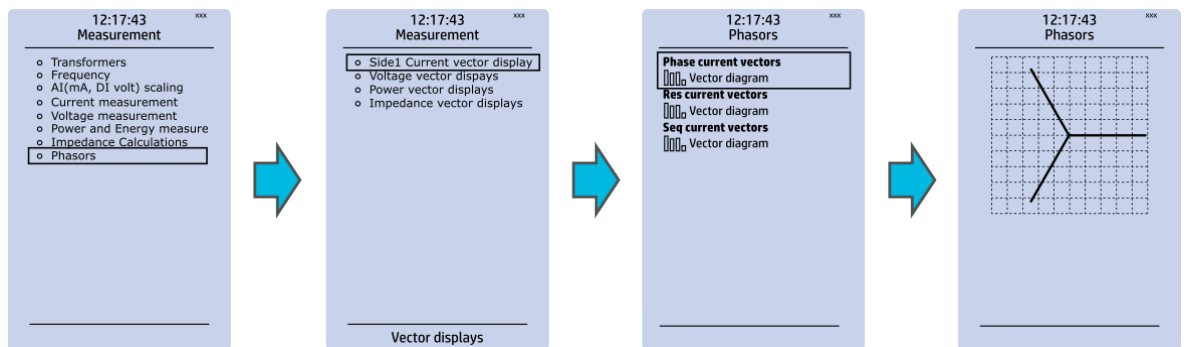

Current measurement submenu includes various individual measurements for each phase or phase-to-phase measurement.

The *Current measurement* submenu has been divided into four sections: "Phase currents", "Residual currents", "Sequence currents", and "Harmonics".

- "Phase currents" and "Residual currents" have been further divided into four subsections ("Per-unit currents", "Primary currents", "Secondary currents" and "Phase angle"), and they display the RMS, TRMS and peak-to-peak values, amplitude and power THD values as well as the angle of each measured component.
- "Sequence currents" has also been further divided into the four above-mentioned sections, and it calculates the positive, negative and zero sequence currents.
- "Harmonics" displays current harmonics up to the 31st harmonic for the three phase current (IL1, IL2, IL3) as well as the two residual currents (I01, I02); each component can be displayed as absolute or percentage values, and as primary or secondary amperages or in per-unit values.

Phasors

Figure. 3.7 - 47. Phasors submenu.

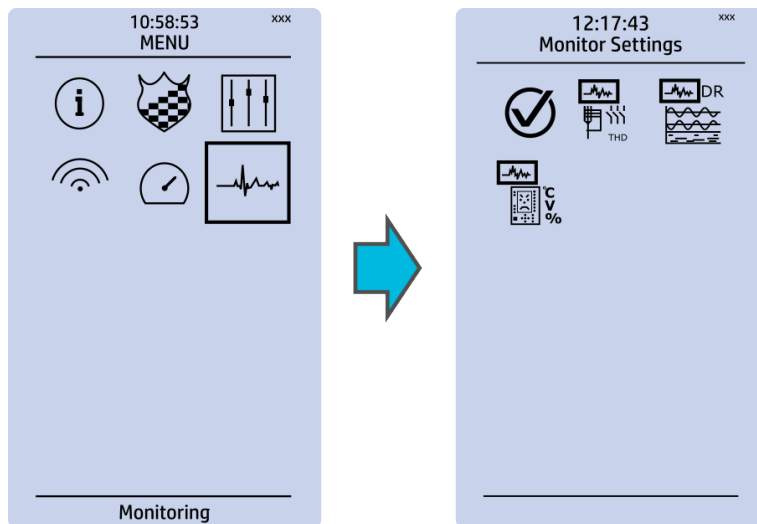

The *Phasors* submenu holds the vector displays for voltages and currents, as well as the various calculated components the device may have (e.g. power, impedance). Phasors are helpful when solving incorrect wiring issues.

3.8 Monitoring menu

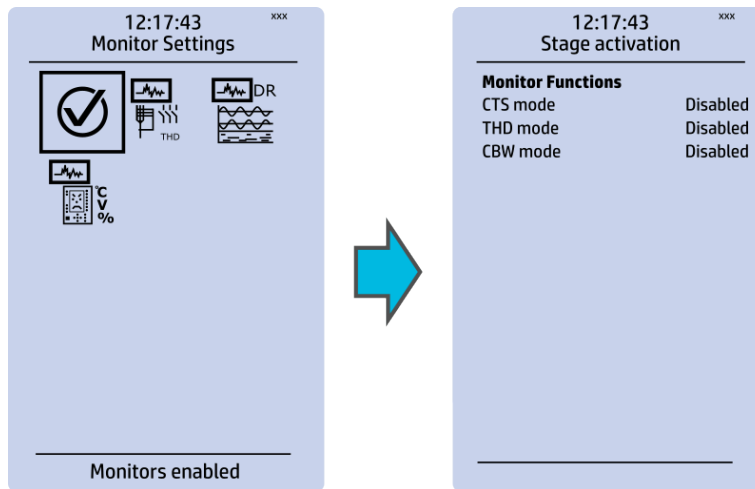

The *Monitoring* main menu includes submenus (see the image below) for enabling the various monitoring functions (*Monitors enabled*), setting the various monitoring functions (*Monitor functions*), controlling the disturbance recorder (*Disturbance REC*) and accessing the device diagnostics (*Device diagnostics*). The available monitoring functions depend on the type of the device in use.

Figure. 3.8 - 48. Monitoring menu view.

Monitors enabled

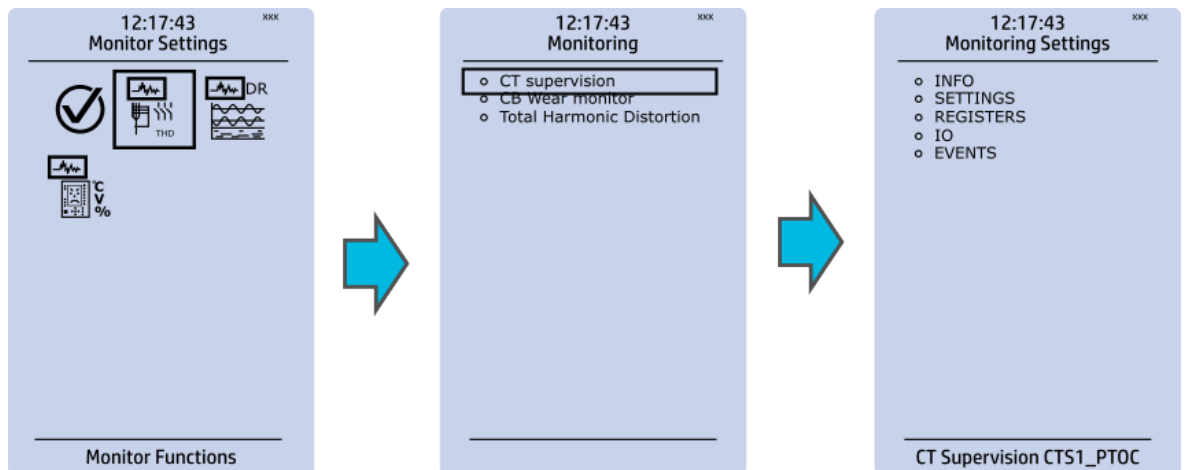

Figure. 3.8 - 49. Monitors enabled submenu.

You can activate the selected monitor functions in the *Monitors enabled* submenu. By default all the control functions are disabled. All activated functions can be viewed in the *Monitor functions* submenu (see the section "Monitor functions" below for more information).

Monitor functions

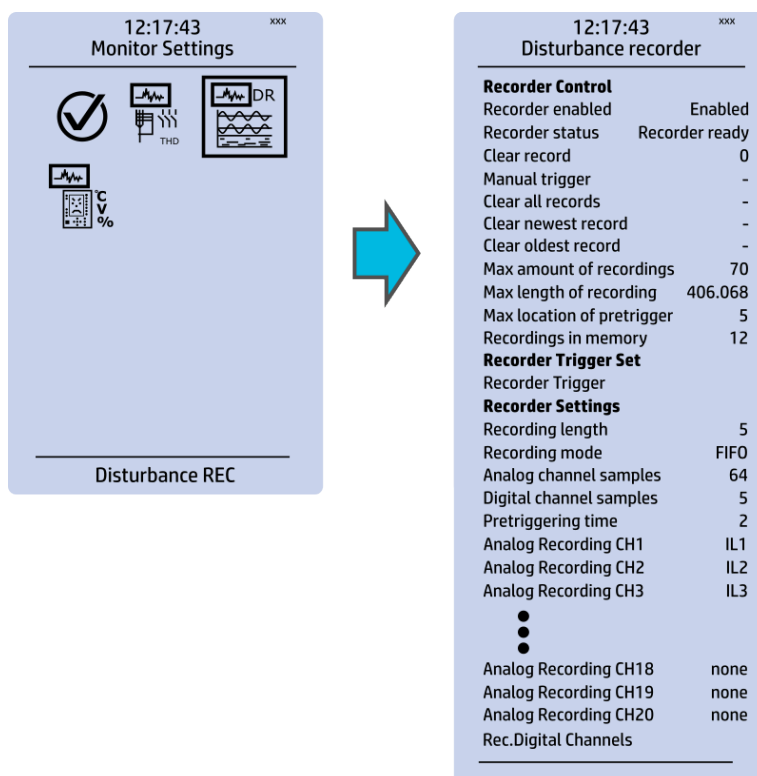

Figure. 3.8 - 50. Monitor function view.

Configuring monitor functions is very similar to configuring protection and control stages. They, too, have the five sections that display information ("Info"), set the parameters ("Settings"), show the inputs and outputs ("I/O") and present the events and registers ("Events" and "Registers").

Disturbance recorder

Figure. 3.8 - 51. Disturbance recorder settings.

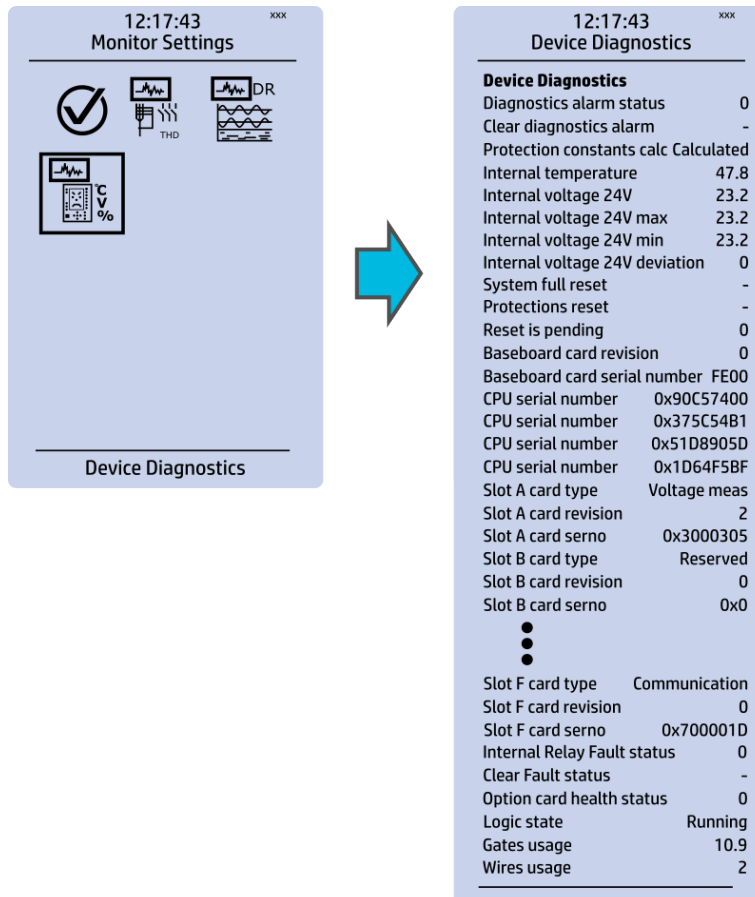

The *Disturbance recorder* submenu has the following settings:

- "Recorder enabled" enables or disables the recorder.
- "Recorder status" indicates the status of the recorder.
- "Clear record" records the chosen record in the memory.
- "Manual trigger" triggers the recorder when set to "Clear". Goes back to "-" when afterwards.
- "Clear all records", "Clear newest record" and "Clear oldest record" allows the clearing of all, the latest, or the oldest recording.
- "Max. amount of recordings" displays the maximum number of recordings; depends on the number of channels, the sample rate and the length of the file.
- "Max. length of recording" displays the maximum length of a single recording; depends on the number of chosen channels and the sample rate.
- "Recordings in memory" displays the number of recordings currently in the disturbance recorder's memory.
- "Recorder trigger" shows which signals or other states has been selected to trigger the recording (digital input, logical input or output, signals of a stage, object position, etc.); by default nothing triggers the recorder.
- "Recording length" displays the length of a single recording and can be set between 0.1...1,800.0 seconds.
- "Recording mode" can be selected to replace the oldest recording ("FIFO") or to keep the old recordings ("FILO").
- "Analog channel samples" determines the sample rate of analog channels, and it can be selected to be 8/16/32/62 samples per cycle.
- "Digital channel samples" displays the sample rate in a digital channel; this is a fixed 5 ms.
- "Pretriggering time" can be selected between 0.1...15.0 s.
- The device can record up to 20 (20) analog channels that can be selected from the twenty (20) available channels. Every measured current or voltage signal can be selected to be recorded.

- Enabling "Auto. get recordings" allows the device to automatically upload recordings to the designated FTP folder (which, in turn, allows any FTP client to read the recordings from the device's memory).
- "Rec. digital channels" is a long list of the possible digital channels that can be recorded (including primary and secondary amplitudes and currents, calculated signals, TRMS values, sequence components, inputs and outputs, etc.).

Device diagnostics

Figure. 3.8 - 52. Device diagnostics submenu.

The *Device Diagnostics* submenu gives a detailed feedback of the device's current condition. It also shows whether option cards have been installed correctly without problems. If you see something out of the ordinary in the *Device diagnostics* submenu and cannot reset it, please contact the closest representative of the manufacturer or the manufacturer of the device itself.

3.9 Configuring user levels and their passwords

As a factory default, no user level is locked with a password in a device. In order to activate the different user levels, click the **Lock** button in the device's HMI and set the desired passwords for the different user levels.

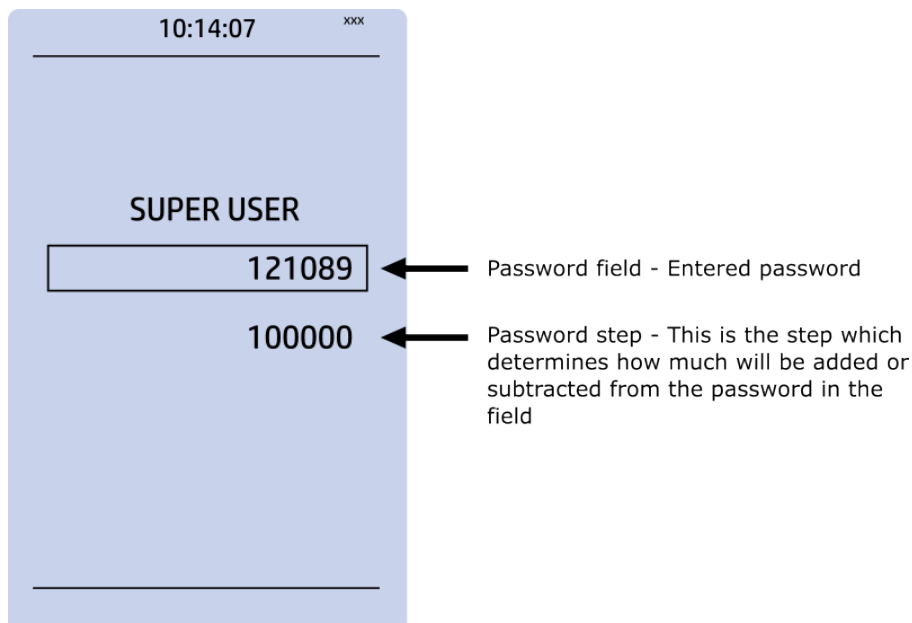

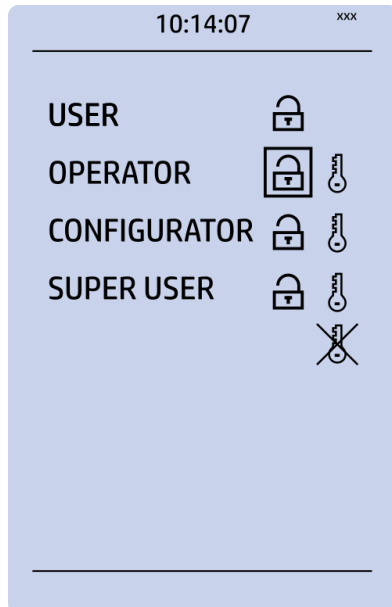

NOTICE!

Passwords can only be set locally in an HMI.

A number of stars are displayed in the upper right corner of the HMI; these indicate the current user level. The different user levels and their star indicators are as follows (also, see the image below for the HMI view):

- Super user (***)
- Configurator (**)
- Operator (*)
- User (-)

You can set a new password for a user level by selecting the key icon next to the user level's name. After this you can lock the user level by pressing the **Return** key while the lock is selected. If you need to change the password, you can select the key icon again and give a new password. To remove the password, set the password to "0" (zero). Please note that in order to do this the user level whose password is being changed must be unlocked.

As mentioned above, the access level of the different user levels is indicated by the number of stars. The required access level to change a parameter is indicated with a star (*) symbol if such is required. As a general rule the access levels are divided as follows:

- *User*: Can view any menus and settings but cannot change any settings, nor operate breakers or other equipment.
- *Operator*: Can view any menus and settings but cannot change any settings BUT can operate breakers and other equipment.
- *Configurator*: Can change most settings such as basic protection pick-up levels or time delays, breaker control functions, signal descriptions etc. and can operate breakers and other equipment.
- *Super user*: Can change any setting and can operate breakers and other equipment.

NOTICE!

Any user level with a password automatically locks itself after half an hour (30 minutes) of inactivity.

4 Functions

4.1 Functions included in AQ-T216

The AQ-T216 transformer protection device includes the following functions as well as the number of stages in those functions.

Table. 4.1 - 4. Protection functions of AQ-T216.

Name (number of stages)	IEC	ANSI	Description
NOC (4)	I> I>> I>>> I>>>>	50/51	Non-directional overcurrent protection
NEF (4)	I0> I0>> I0>>> I0>>>>	50N/51N	Non-directional earth fault protection
CUB (4)	I2> I2>> I2>>> I2>>>>	46/46R/46L	Negative sequence overcurrent/ phase current reversal/ current unbalance protection
HOC (4)	Ih> Ih>> Ih>>> Ih>>>>	50H/51H/ 68H	Harmonic overcurrent protection
CBFP (1)	CBFP	50BF/52BF	Circuit breaker failure protection
REF (1)	I0d>	87N	Low-impedance or high-impedance restricted earth fault/ cable end differential protection
TRF	-	-	Transformer status monitoring
DIF (1)	I _{db} >/I _{di} >/I _{0dHV} >/I _{0dLV} >	87T/87N/87G	Generator/transformer differential protection
TOLT (1)	TT>	49T	Transformer thermal overload protection
RTD (1...16)	-	-	RTD alarms (Resistance temperature detector)
PGS (1)	PGx>/<	99	Programmable stage
ARC (1)	I _{Arc} >/I _{0Arc} >	50Arc/ 50NArc	Arc fault protection (optional)

Table. 4.1 - 5. Control functions of AQ-T216.

Name	IEC	ANSI	Description
SGS	-	-	Setting group selection

Name	IEC	ANSI	Description
OBJ	-	-	Object control and monitoring (5 objects available)
CIN	-	-	Indicator object monitoring (5 indicators available)
CLPU	CLPU	-	Cold load pick-up
PCS	-	-	Programmable control switch
mA output	-	-	Milliampere output control

Table. 4.1 - 6. Monitoring functions of AQ-T216.

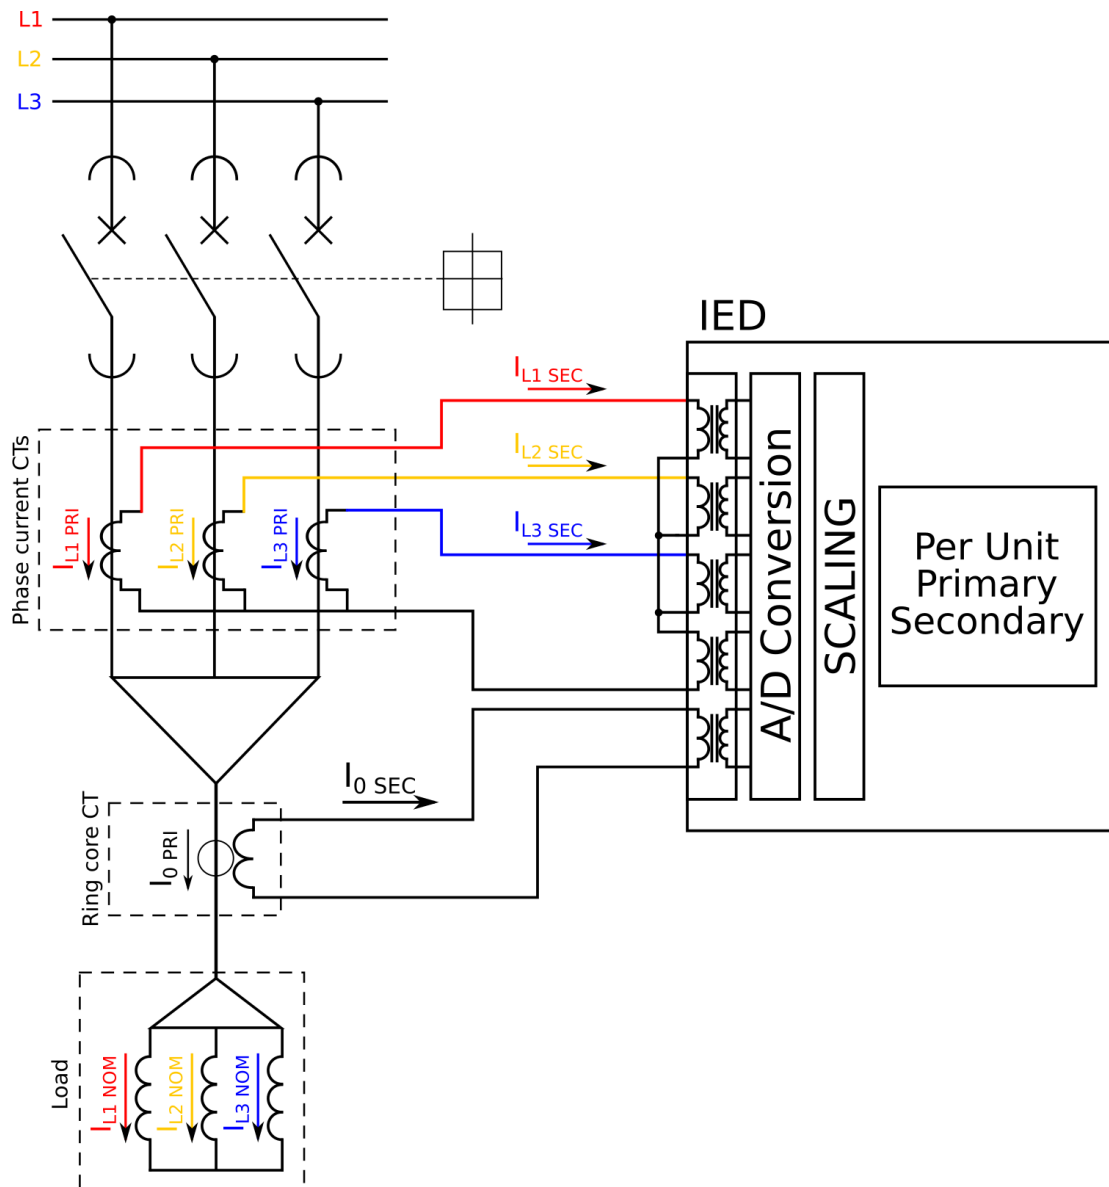

Name	IEC	ANSI	Description
CTS (2)	-	-	Current transformer supervision
DR	-	-	Disturbance recorder
CBW	-	-	Circuit breaker wear monitor
THD	-	-	Total harmonic distortion
RHC	-	-	Running hour counter
MREC	-	-	Measurement recorder
VREC	-	-	Measurement value recorder

4.2 Measurements

4.2.1 Current measurement and scaling in differential applications

The current measurement module (CT module, or CTM) is used for measuring the currents from current transformers. The current measurements are updated every 5 milliseconds. The measured values are processed into the measurement database and they are used by measurement and protection functions. It is essential to understand the concept of current measurements to be able to get correct measurements.

Figure. 4.2.1 - 53. Current measurement terminology.

PRI: The primary current, i.e. the current which flows in the primary circuit and through the primary side of the current transformer.

SEC: The secondary current, i.e. the current which the current transformer transforms according to its ratios. This current is measured by the device.

NOM: The nominal primary current of the protected transformer. The nominal current on the HV side differs from that on the LV side according to the transformer voltage ratio. The nominal current is calculated based on the transformer's MVA and the nominal voltage on each winding.

For the measurements to be correct the user needs to ensure that the measurement signals are connected to the correct inputs, that the current direction is connected correctly, and that the scaling is set correctly.

The device calculates the scaling factors based on the set values of the CT primary, the CT secondary and the nominal current. The device measures the secondary current, the current output from the current transformer installed into application's primary circuit. The rated primary and secondary currents of the CT need to be set for the device to "know" the primary and per-unit values. In power transformers, the protected unit's nominal current in both windings is calculated based on the given nominal power (MVA) and the nominal voltage. The settings can only give the apparatus nominal in p.u. (per-unit) when the nominal current is known. Also, knowing what the transformer's nominal current is makes the unit protection much easier and more straightforward to configure. In modern protection devices this scaling calculation is done internally after the current transformer's primary current, secondary current and machine nominal current are set.

Figure. 4.2.1 - 54. Nominal current calculation in differential protection devices.

The screenshot displays the 'TrafoModule' configuration window with the 'Current' tab selected. The 'TSTAT' section shows 'Idx> [87T,87N]'. The 'Trafo Status [TRF]' section has tabs for 'INFO', 'ON-LINE DATA', 'REGISTERS', 'IO', and 'EVENTS'. Under 'Transformer Characteristics', there are three rows: 'Transformer nominal MVA' set to 153 MVA, 'HV side nominal voltage' set to 132 kV, and 'LV side nominal voltage' set to 15 kV. Below this, 'CT Scaling HV Side' shows 'Nominal current In' set to 669.201 A. 'CT Scaling LV Side' shows 'Nominal current In' set to 5888.973 A. All values are within their respective ranges and are marked with '***'.

Parameter	Value	Unit	Range	Status
Transformer nominal MVA	153	MVA	0.1...500.0 [0.1]	***
HV side nominal voltage	132	kV	0.1...500.0 [0.1]	***
LV side nominal voltage	15	kV	0.1...500.0 [0.1]	***
CT Scaling HV Side Nominal current In	669.201	A	1.000...25000.000 [0.001]	***
CT Scaling LV Side Nominal current In	5888.973	A	1.000...25000.000 [0.001]	***

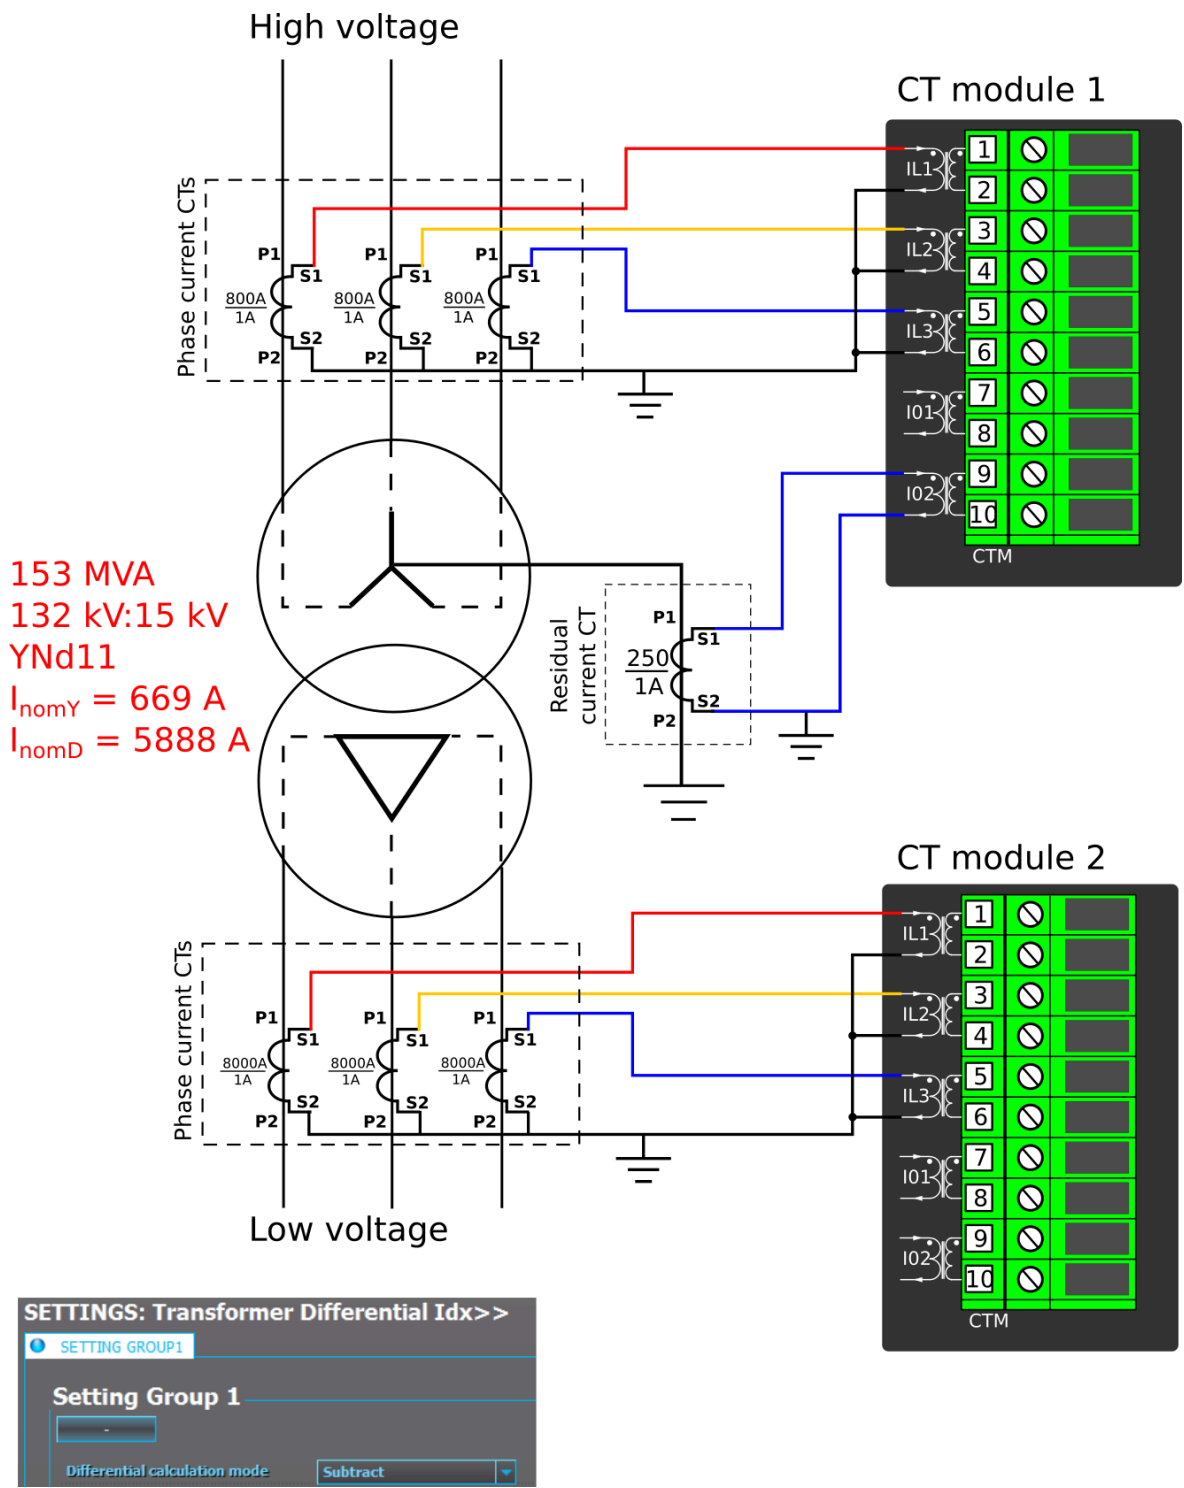

Normally, the primary current ratings for phase current transformers are ten amperes to thousands of amperes and their decimal multiples, while the secondary current ratings are 1 A and 5 A. Other, non-standard ratings can be directly connected as the scaling settings are flexible and have large ranges. For example, the ring core current transformer ratings may vary. Ring core current transformers are commonly used for sensitive earth fault protection and their rated secondary may be as low as 0.2 A in some cases.

The following chapter is an example on how to set the scaling of the device measurements for the selected current transformer and nominal load.

Example of CT scaling (application 1)

The following figure presents how CTs are connected to the device's measurement inputs. It also shows the CT ratings and the transformer nominal current. Note that S1 is always connected to an odd connector regardless of the CT direction. The CT direction is selected in the settings of the transformer differential protection function.

Figure. 4.2.1 - 55. Connections (application 1).

Because of the direction of the CTs and because the CTs' P1/S1 side is always wired to the modules' odd inputs, the "Differential calculation mode" setting has to be set to "Subtract" (*Protection* → *TrafoModule* → *Idx* > [87T,87N] → *Settings*). This way the direction of the measured currents are checked correctly from the device's perspective.

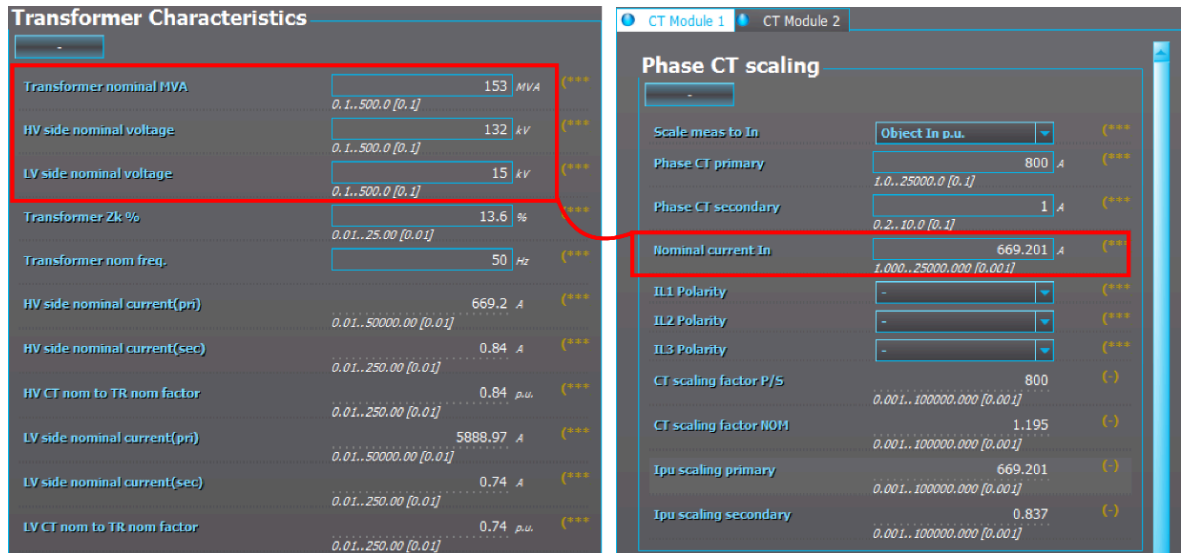

The following table presents the initial data of the connection as well as the ratings.

Table. 4.2.1 - 7. Initial data.

High-voltage side CT: <ul style="list-style-type: none"> CT primary: 800 A CT secondary: 1 A High-voltage side nominal current: 669 A	Ring core CT in Input I02: <ul style="list-style-type: none"> 3I0CT primary: 250 A 3I0CT secondary: 1 A 	Low-voltage side CT: <ul style="list-style-type: none"> CT primary: 8 000 A CT secondary: 1 A Low-voltage side nominal current: 5 888 A
<ul style="list-style-type: none"> Both CTs are pointing through the transformer (HV-S2 and LV-S2 are pointing in the same direction). 		

The nominal current for both the HV and LV sides of the protected transformer are calculated based on the values set in the *Transformer characteristics* menu (*Protection* → *TrafoModule* → *TSTAT* → *INFO*). The ratio between the CT modules 1 and 2 can be set in their respective tabs at *Measurement* → *Transformers*. The per-unit scaling ("Scale meas. to In") is automatically set to "Object in p.u." in all machine protection devices and it cannot be changed.

Figure. 4.2.1 - 56. Phase CT scaling to machine nominal.

As seen in the image above, device calculates both the HV side nominal current (669.2 A) and the LV side nominal current (5,888.97 A). The nominal current calculations are done according to the following formulas:

$$\text{HV side nominal current (pri)} = \frac{trafo_{nom}/3}{U_{HV}/\sqrt{3}} = \frac{153\,000\,000/3}{132\,000/\sqrt{3}} \approx 669.201\text{ A}$$

$$\text{LV side nominal current (pri)} = \frac{trafo_{nom}/3}{U_{LV}/\sqrt{3}} = \frac{153\,000\,000/3}{15\,000/\sqrt{3}} \approx 5888.97\text{ A}$$

The HV and LV side nominal current can also be calculated in per unit values as follows:

$$\text{HV CT nom to TR nom factor} = \frac{\text{HV side nominal current (pri)}}{\text{Phase CT primary}} = \frac{669.2\text{ A}}{800\text{ A}} \approx 0.84\text{ p.u.}$$

$$\text{LV CT nom to TR nom factor} = \frac{\text{LV side nominal current (pri)}}{\text{Phase CT primary}} = \frac{5888.97\text{ A}}{8000\text{ A}} \approx 0.74\text{ p.u.}$$

The secondary nominal current (in amperes) is the result of multiplying the per unit value with the phase CT secondary side current. This current can be used when the unit is commissioned and when the directions of CTs are checked. See the example calculation below:

HV side nominal current (sec)

$$= HV \text{ CT nom to TR nom factor} \times \text{Phase CT secondary} = 0.84 \text{ p.u.} \times 1 \text{ A} = 0.84 \text{ A}$$

LV side nominal current (sec)

$$= LV \text{ CT nom to TR nom factor} \times \text{Phase CT secondary} = 0.74 \text{ p.u.} \times 1 \text{ A} = 0.74 \text{ A}$$

In case the phase current CTs are connected to the module via a Holmgren (summing) connection, the use of coarse residual current measurement settings is required: the "I01 CT" settings are set according to the phase current CTs' ratings (800/1 A).

Figure. 4.2.1 - 57. Residual I01 CT scaling (coarse).

Setting	Value	Unit	Range	Precision	Warning
I01 CT primary	800	A	0.20..25000.00	[0.10]	***
I01 CT secondary	1	A	0.10..10.00	[0.10]	***
I01 Polarity	-				***
CT scaling factor P/S	800		0.001..100000.000	[0.001]	(-)

The residual current CT is connected to the first CTM directly, which requires the use of sensitive residual current measurement settings: the "Residual I02 CT scaling" settings are set according to the residual current CT's ratings (250/1 A).

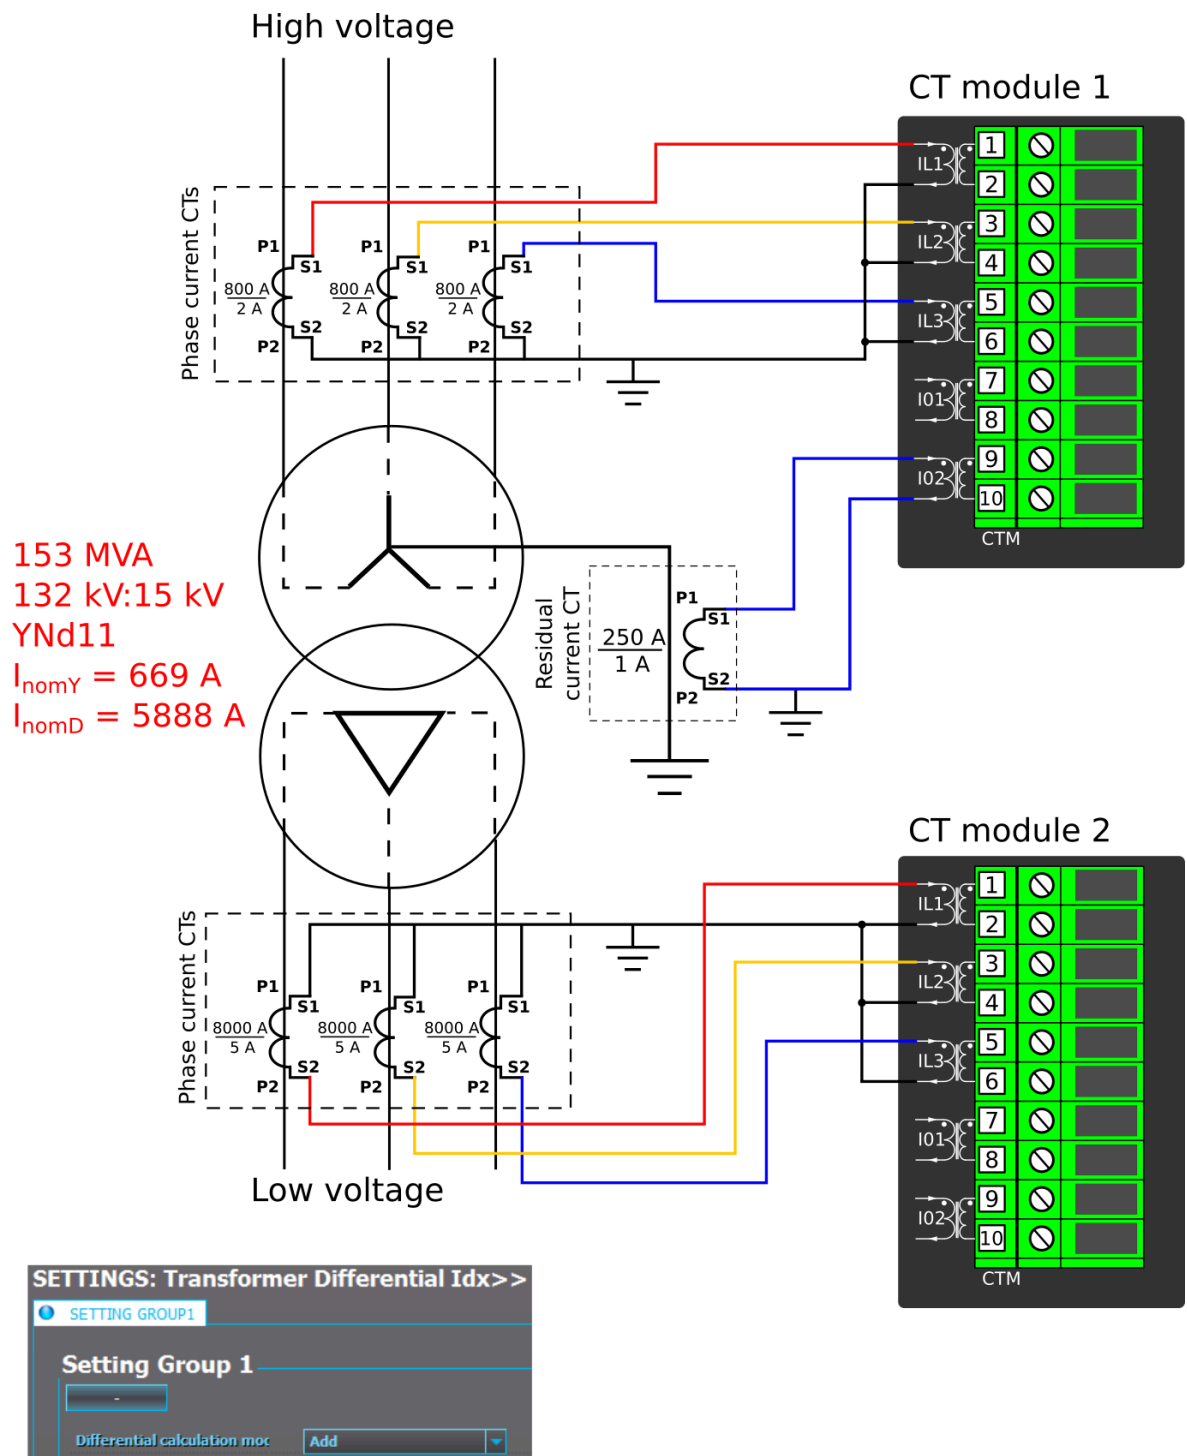

Figure. 4.2.1 - 58. Residual I02 CT scaling (sensitive).

Setting	Value	Unit	Range	Precision	Warning
I02 CT primary	250	A	0.20..25000.00	[0.10]	***
I02 CT secondary	1	A	0.10..10.00	[0.10]	***
I02 Polarity	-				***
CT scaling factor P/S	250		0.001..100000.000	[0.001]	(-)

Example of CT scaling (application 2)

The following figure presents how the CTs are connected to the device's measurement inputs. It also shows the CT ratings and the transformer nominal current. Note that S1 is always connected to an odd connector regardless of the CT direction. The CT direction is selected in the settings of the transformer differential protection function.

Figure. 4.2.1 - 59. Connections (application 2).

Because of the direction of the CTs and because the CTs' P1/S1 side is always wired to the modules's odd inputs, the "Differential calculation mode" has to be set to "Add" (*Protection* → *TrafoModule* → *Idx* → [87T,87N] → *Settings*). The difference with the first application is that here the CTs point towards the protected object instead of pointing through it.

The following table presents the initial data of the connection as well as the ratings.

Table. 4.2.1 - 8. Initial data.

Machine nominal power: 153 MVA Machine high voltage side nominal amplitude: 132 kV Machine low voltage side nominal amplitude: 15 kV		
High voltage side CT: <ul style="list-style-type: none"> CT primary: 800 A CT secondary: 2 A High-voltage side nominal current: 669 A	Residual current CT in Input I02: <ul style="list-style-type: none"> 3I0CT primary: 250 A 3I0CT secondary: 1 A 	Low voltage side CT. <ul style="list-style-type: none"> CT primary: 8 000 A CT secondary: 5 A Low-voltage side nominal current: 5 888 A
<ul style="list-style-type: none"> Both CTs are pointing towards the protected object (HV-S2 and LV-S2 are pointing at each other). 		

The nominal currents on both the HV and the LV sides are the same as in Application 1. However, the CTs' secondary current levels have been changed to 2 A (on the HV side) and to 5 A (on the LV side). The nominal currents are still calculated the same way:

$$\text{HV side nominal current (pri)} = \frac{trafo_{nom}/3}{U_{HV}/\sqrt{3}} = \frac{153\,000\,000/3}{132\,000/\sqrt{3}} \approx 669.201 \text{ A}$$

$$\text{LV side nominal current (pri)} = \frac{trafo_{nom}/3}{U_{LV}/\sqrt{3}} = \frac{153\,000\,000/3}{15\,000/\sqrt{3}} \approx 5888.97 \text{ A}$$

The HV and LV side nominal current can also be calculated in per unit values as follows:

$$\text{HV CT nom to TR nom factor} = \frac{\text{HV side nominal current (pri)}}{\text{Phase CT primary}} = \frac{669.2 \text{ A}}{800 \text{ A}} \approx 0.84 \text{ p. u.}$$

$$\text{LV CT nom to TR nom factor} = \frac{\text{LV side nominal current (pri)}}{\text{Phase CT primary}} = \frac{5888.97 \text{ A}}{8000 \text{ A}} \approx 0.74 \text{ p. u.}$$

The secondary nominal current (in amperes) is the result of multiplying the per unit value with the phase CT secondary side current. This current can be used when the unit is commissioned and when the directions of CTs are checked. In Application 2 it is necessary to inject higher amplitudes to the CTs via the secondary injection tool in order to reach the nominal currents. See the example calculation below:

HV side nominal current (sec)

$$= \text{HV CT nom to TR nom factor} \times \text{Phase CT secondary} = 0.84 \text{ p. u.} \times 2 \text{ A} = 1.68 \text{ A}$$

LV side nominal current (sec)

$$= \text{LV CT nom to TR nom factor} \times \text{Phase CT secondary} = 0.74 \text{ p. u.} \times 5 \text{ A} = 3.70 \text{ A}$$

Settings

Table. 4.2.1 - 9. Settings of the Phase CT scaling.

Name	Unit	Range	Step	Default	Description
Scale measurement to In	-	<ul style="list-style-type: none"> CT nom p.u. Object In p.u. 	-	<ul style="list-style-type: none"> CT nom p.u. 	<p>The selection of the reference used in the device's per-unit system scaling. Either the set phase current CT primary or the protected object's nominal current.</p> <div>  CAUTION! Not applicable in machine protection! </div>
Phase CT primary	A	1...25 000	0.001	100	The rated primary current of the current transformer.
Phase CT secondary	A	0.2...10	0.001	5	The rated secondary current of the current transformer.
Nominal current In	A	1...25 000	0.001	100	The nominal current of the protected object. This setting is only visible if the option "Object In p.u." has been selected in the "Scale meas. to In" setting.
IL1 Polarity	-	<ul style="list-style-type: none"> - Invert 	-	<ul style="list-style-type: none"> - 	The selection of the first current measurement channel's (IL1) polarity (direction). IL2 Polarity	-	<ul style="list-style-type: none"> - Invert 	-	<ul style="list-style-type: none"> - 	The selection of the second current measurement channel's (IL2) polarity (direction). The default setting is for the positive current to flow from connector 3 to connector 4, with the secondary currents' starpoint pointing towards the line.
IL3 Polarity	-	<ul style="list-style-type: none"> - Invert 	-	<ul style="list-style-type: none"> - 	The selection of the third current measurement channel's (IL3) polarity (direction). The default setting is for the positive current to flow from connector 5 to connector 6, with the secondary currents' starpoint pointing towards the line.
CT scaling factor P/S	-	-	-	-	A feedback value; the calculated scaling factor that is the ratio between the primary current and the secondary current.
CT scaling factor NOM	-	-	-	-	A feedback value; the calculated scaling factor that is the ratio between the set primary current and the set nominal current.

Name	Unit	Range	Step	Default	Description
lpu scaling primary	-	-	-	-	A feedback value; the scaling factor for the primary current's per-unit value.
lpu scaling secondary	-	-	-	-	A feedback value; the scaling factor for the secondary current's per-unit value.

Table. 4.2.1 - 10. Settings of the Residual I01 CT scaling.

Name	Unit	Range	Step	Default	Description
I01 CT primary	A	0.2...25 000	0.000 01	100	The rated primary current of the current transformer.
I01 CT secondary	A	0.1...10	0.000 01	1.0	The rated secondary current of the current transformer.
I01 Polarity	-	<ul style="list-style-type: none"> - Invert 	-	-	The selection of the coarse residual measurement channel's (I01) polarity (direction). The default setting is for the positive current to flow from connector 7 to connector 8.
CT scaling factor P/S	-	-	-	-	A feedback value; the calculated scaling factor that is the ratio between the primary current and the secondary current.

Table. 4.2.1 - 11. Settings of the Residual I02 CT scaling.

Name	Unit	Range	Step	Default	Description
I02 CT primary	A	1...25 000	0.000 01	100	The rated primary current of the current transformer.
I02 CT secondary	A	0.001...10	0.000 01	0.2	The rated secondary current of the current transformer.
I02 Polarity	-	<ul style="list-style-type: none"> - Invert 	-	-	The selection of the sensitive residual measurement channel's (I02) polarity (direction). The default setting is for the positive current to flow from connector 9 to connector 10.
CT scaling factor P/S	-	-	-	-	A feedback value; the calculated scaling factor that is the ratio between the primary current and the secondary current.

Measurements

The following measurements are available in the measured current channels.

Table. 4.2.1 - 12. Per-unit phase current measurements.

Name	Unit	Range	Step	Description
Phase current ILx ("Pha.curr.ILx")	× In	0.000...1 250.000	0.001	The RMS current measurement (in p.u.) from each of the phase current channels.

Name	Unit	Range	Step	Description
Phase current ILx TRMS ("Pha.curr.ILx TRMS")	× In	0.000...1 250.000	0.001	The TRMS current (inc. harmonics up to 31 st) measurement (in p.u.) from each of the phase current channels.
Peak-to-peak current ILx ("P-P curr.ILx")	× In	0.000...500.000	0.001	The peak-to-peak current measurement (in p.u.) from each of the phase current channels.

Table. 4.2.1 - 13. Primary phase current measurements.

Name	Unit	Range	Step	Description
Primary phase current ILx ("Pri.Pha.curr.ILx")	A	0.000...1 000 000.000	0.001	The primary RMS current measurement from each of the phase current channels.
Primary phase current ILx TRMS ("Pha.curr.ILx TRMS Pri")	A	0.000...1 000 000.000	0.001	The primary TRMS current (inc. harmonics up to 31 st) measurement from each of the phase current channels.

Table. 4.2.1 - 14. Secondary phase current measurements.

Name	Unit	Range	Step	Description
Secondary phase current ILx "Sec.Pha.curr.ILx")	A	0.000...300.000	0.001	The primary RMS current measurement from each of the phase current channels.
Secondary phase current ILx TRMS ("Pha.curr.ILx TRMS Sec")	A	0.000...300.000	0.001	The primary TRMS current (inc. harmonics up to 31 st) measurement from each of the phase current channels.

Table. 4.2.1 - 15. Phase current angle measurements.

Name	Unit	Range	Step	Description
Phase angle ILx ("Pha.angle ILx")	deg	0.000...360.000	0.001	The phase angle measurement from each of the three phase current inputs.

Table. 4.2.1 - 16. Per-unit residual current measurements.

Name	Unit	Range	Step	Description
Residual current I0x ("Res.curr.I0x")	× In	0.000...1 250.000	0.001	The RMS current measurement (in p.u.) from the residual current channel I01 or I02.
Calculated I0	× In	0.000...1 250.000	0.001	The RMS current measurement (in p.u.) from the calculated I0 current channel.

Name	Unit	Range	Step	Description
Phase current I0x TRMS ("Res.curr.I0x TRMS")	× In	0.000...1 250.000	0.001	The TRMS current (inc. harmonics up to 31 st) measurement (in p.u.) from the residual current channel I01 or I02.
Peak-to-peak current I0x ("P-P.curr.I0x")	× In	0.000...500.000	0.001	The peak-to-peak current measurement (in p.u.) from the residual current channel I01 or I02.

Table. 4.2.1 - 17. Primary residual current measurements.

Name	Unit	Range	Step	Description
Primary residual current I01 ("Pri.Res.curr.I0x")	A	0.000...1 000 000.000	0.001	The primary RMS current measurement from the residual current channel I01 or I02.
Primary calculated I0 ("Pri.calc.I0")	A	0.000...1 000 000.000	0.001	The primary RMS current measurement from the calculated current channel I0.
Primary residual current I0x TRMS ("Res.curr.I01 TRMS Pri")	A	0.000...1 000 000.000	0.001	The TRMS current (inc. harmonics up to 31 st) measurement from the primary residual current channel I01 or I02.

Table. 4.2.1 - 18. Secondary residual current measurements.

Name	Unit	Range	Step	Description
Secondary residual current I0x ("Sec.Res.curr.I0x")	A	0.000...300.000	0.001	The secondary RMS current measurement from the residual current channel I01 or I02.
Secondary calculated I0 ("Sec.calc.I0")	A	0.000...300.000	0.001	The secondary RMS current measurement from the calculated current channel I0.
Secondary residual current I0x TRMS ("Res.curr.I0x TRMS Sec")	A	0.000...300.000	0.001	The secondary TRMS current (inc. harmonics up to 31 st) measurement from the secondary residual current channel I01 or I02.

Table. 4.2.1 - 19. Residual current phase angle measurements.

Name	Unit	Range	Step	Description
Residual current angle I0x ("Res.curr.angle I0x")	deg	0.000...360.000	0.001	The residual current angle measurement from the I01 or I02 current input.
Calculated I0 angle	deg	0.000...360.000	0.001	The calculated residual current angle measurement.

Table. 4.2.1 - 20. Per-unit sequence current measurements.

Name	Unit	Range	Step	Description
Positive sequence current ("Positive sequence curr.")	× In	0.00...1 250.0	0.001	The measurement (in p.u.) from the calculated positive sequence current.
Negative sequence current ("Negative sequence curr.")	× In	0.00...1 250.0	0.001	The measurement (in p.u.) from the calculated negative sequence current.
Zero sequence current ("Zero sequence curr.")	× In	0.00...1 250.0	0.001	The measurement (in p.u.) from the calculated zero sequence current.

Table. 4.2.1 - 21. Primary sequence current measurements.

Name	Unit	Range	Step	Description
Primary positive sequence current ("Pri.Positive sequence curr.")	A	0.00...1 000 000.0	0.001	The primary measurement from the calculated positive sequence current.
Primary negative sequence current ("Pri.Negative sequence curr.")	A	0.00...1 000 000.0	0.001	The primary measurement from the calculated negative sequence current.
Primary zero sequence current ("Pri.Zero sequence curr.")	A	0.00...1 000 000.0	0.001	The primary measurement from the calculated zero sequence current.

Table. 4.2.1 - 22. Secondary sequence current measurements.

Name	Unit	Range	Step	Description
Secondary positive sequence current ("Sec.Positive sequence curr.")	A	0.000...300.000	0.001	The secondary measurement from the calculated positive sequence current.
Secondary negative sequence current ("Sec.Negative sequence curr.")	A	0.000...300.000	0.001	The secondary measurement from the calculated negative sequence current.
Secondary zero sequence current ("Sec.Zero sequence curr.")	A	0.000...300.000	0.001	The secondary measurement from the calculated zero sequence current.

Table. 4.2.1 - 23. Sequence phase angle measurements.

Name	Unit	Range	Step	Description
Positive sequence current angle ("Positive sequence curr.angle")	deg	0.000...360.0	0.001	The calculated positive sequence current angle.
Negative sequence current angle ("Negative sequence curr.angle")	deg	0.000...360.0	0.001	The calculated negative sequence current angle.
Zero sequence current angle ("Zero sequence curr.angle")	deg	0.000...360.0	0.001	The calculated zero sequence current angle.

Table. 4.2.1 - 24. Harmonic current measurements.

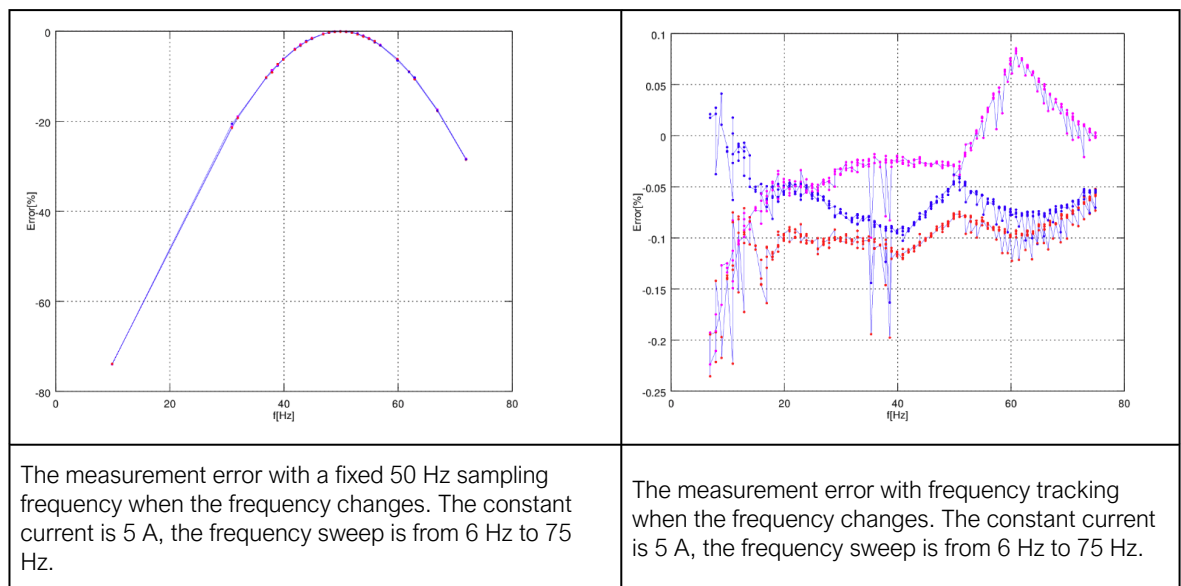

Name	Unit	Range	Step	Default	Description
Harmonics calculation values ("Harm Abs.pr Perc.")	-	<ul style="list-style-type: none"> Percent Absolute 	-	Percent	Defines whether the harmonics are calculated as percentage or absolute values.
Harmonics display	-	<ul style="list-style-type: none"> Per unit Primary A Secondary A 	-	Per unit	Defines how the harmonics are displayed: in p.u. values, as primary current values, or as secondary current values.
Maximum harmonics value ("IxxMaximum harmonic")	A	0.000...1 000 000.000	0.001	-	Displays the maximum harmonics value of the selected current input ILx or IOx.
Fundamental frequency ("Ixx fundamental")	A	0.000...1 000 000.000	0.001	-	Displays the current value of the fundamental frequency measurement (RMS) from the selected current input ILx or IOx.
Ixx harmonics (2 nd ...31 st harmonic)	A	0.000...1 000 000.000	0.001	-	Displays the selected harmonic from the current input ILx or IOx.

4.2.2 Frequency tracking and scaling

Measurement sampling can be set to the frequency tracking mode or to the fixed user-defined frequency sampling mode. The benefit of frequency tracking is that the measurements are within a pre-defined accuracy range even when the fundamental frequency of the power system changes.

Frequency independent current and voltage measurement accuracy is achieved with algorithms specified in patent US 10,809,287.

Table. 4.2.2 - 25. Frequency tracking effect (FF changes from 6 Hz to 75 Hz).

As the figures above show, the sampling frequency has a major effect on the device's measurement accuracy. If the sampling is not tracked to the system frequency, for example a 10 Hz difference between the measured and the set system frequency can give a measurement error of over 5 %. The figures also show that when the frequency is tracked and the sampling is adjusted according to the detected system frequency, the measurement accuracy has an approximate error of 0.1... - 0.2 % error in the whole frequency range.

AQ -200 series devices have a measurement accuracy that is independent of the system frequency. This has been achieved by adjusting the sample rate of the measurement channels according to the measured system frequency; this way the FFT calculation always has a whole power cycle in the buffer. The measurement accuracy is further improved by Arcteq's patented calibration algorithms that calibrate the analog channels against eight (8) system frequency points for both magnitude and angle. This frequency-dependent correction compensates the frequency dependencies in the used, non-linear measurement hardware and improves the measurement accuracy significantly. Combined, these two methods give an accurate measurement result that is independent of the system frequency.

Troubleshooting

When the measured current, voltage or frequency values differ from the expected values, the following table offers possible solutions for the problems.

Problem	Check / Resolution
The measured current or voltage amplitude is lower than it should be./ The values are "jumping" and are not stable.	The set system frequency may be wrong. Please check that the frequency settings match the local system frequency, or change the measurement mode to "Tracking" (<i>Measurement</i> → <i>Frequency</i> → "Sampling mode") so the device adjusts the frequency itself.
The frequency readings are wrong.	In Tracking mode the device may interpret the frequency incorrectly if no current is injected into the CT (or voltage into the VT). Please check the frequency measurement settings (<i>Measurement</i> → <i>Frequency</i>).

Settings

Table. 4.2.2 - 26. Settings of the frequency tracking.

Name	Range	Step	Default	Description
Sampling mode	<ul style="list-style-type: none"> Fixed Tracking 	-	Fixed	Defines which measurement sampling mode is in use: the fixed user-defined frequency, or the tracked system frequency.
Max. tracking frequency allowed (+Nom freq.)	0.001...75.000 Hz	0.001 Hz	0.001 Hz	Defines the upper limit for the deviation from the system nominal frequency to be tracked. If the frequency increases more than allowed from the nominal value, the tracking is discarded and the value of the nominal frequency will be used.
System nominal frequency	7.000...75.000Hz	0.001Hz	50Hz	The user-defined system nominal frequency that is used when the "Sampling mode" setting has been set to "Fixed".
Min. tracking frequency allowed (-Nom freq.)	0.001...75.000 Hz	0.001 Hz	0.001 Hz	Defines the lower limit for the deviation from the system nominal frequency to be tracked. If the frequency decreases more than allowed from the nominal value, the tracking is discarded and the value of the nominal frequency will be used.
Tracked system frequency	0.000...75.000Hz	0.001Hz	-	Displays the rough measured system frequency.
Sampling frequency in use	0.000...75.000Hz	0.001Hz	-	Displays the tracking frequency that is in use at that moment.
Frequency reference 1	<ul style="list-style-type: none"> None CT1IL1 CT2IL1 VT1U1 VT2U1 	-	CT1IL1	The first reference source for frequency tracking.
Frequency reference 2	<ul style="list-style-type: none"> None CT1IL2 CT2IL2 VT1U2 VT2U2 	-	CT1IL2	The second reference source for frequency tracking.
Frequency reference 3	<ul style="list-style-type: none"> None CT1IL3 CT2IL3 VT1U3 VT2U3 	-	CT1IL3	The third reference source for frequency tracking.

Name	Range	Step	Default	Description
Frequency tracking quality	<ul style="list-style-type: none"> No trackable channels Reference 1 trackable Reference 2 trackable References 1 & 2 trackable Reference 3 trackable Reference 1 & 3 trackable References 2 & 3 trackable All references trackable 	-	-	Defines the frequency tracker quality. If the measured current (or voltage) amplitude is below the threshold, the channel tracking quality is 0 and cannot be used for frequency tracking. If all channels' magnitudes are below the threshold, there are no trackable channels.
Frequency measurement in use	<ul style="list-style-type: none"> No track ch Ref1 Ref2 Ref3 	-	-	Indicates which reference is used at the moment for frequency tracking.
Start behavior	<ul style="list-style-type: none"> Start tracking immediately First nominal or tracked 	-	Start tracking immediately	Defines the how the tracking starts. Tracking can start immediately, or there can be a set delay time between the receiving of the first trackable channel and the start of the tracking.
Start sampling with	<ul style="list-style-type: none"> Use track frequency Use nom frequency 	-	Use track frequency	Defines the start of the sampling. Sampling can begin with a previously tracked frequency, or with a user-set nominal frequency.
Use nominal frequency until	0...1800.000s	0.005s	0.100s	Defines how long the nominal frequency is used after the tracking has started. This setting is only valid when the "Sampling mode" setting is set to "Tracking" and when the "Start behavior" is set to "First nominal or tracked".
Tracked f channel A	0.000...75.000Hz	0.001Hz	-	Displays the rough value of the tracked frequency in Channel A.
Tracked f channel B	0.000...75.000Hz	0.001Hz	-	Displays the rough value of the tracked frequency in Channel B.
Tracked f channel C	0.000...75.000Hz	0.001Hz	-	Displays the rough value of the tracked frequency in Channel C.
System measured frequency	<ul style="list-style-type: none"> One f measured Two f measured Three f measured 	-	-	Displays the amount of frequencies that are measured.
f.atm. Protections	0.000...75.000Hz	0.001Hz	-	Frequency measurement value used by protection functions. When frequency is not measurable this value returns to value set to "System nominal frequency" parameter.

Name	Range	Step	Default	Description
f.atm. Display	0.000...75.000Hz	0.001Hz	-	Frequency measurement value used in display. When frequency is not measurable this value is "0 Hz".
f measurement from	<ul style="list-style-type: none"> • Not measurable • Avg Ref 1 • Avg Ref 2 • Avg Ref 3 • Track Ref 1 • Track Ref 2 • Track Ref 3 • Fast Ref 1 • Fast Ref 2 • Fast Ref 3 	-	-	Displays which reference is used for frequency measurement.
SS1.meas.frqs	0.000...75.000Hz	0.001Hz	-	Displays frequency used by "system set" channel 1 and 2.
SS2.meas.frqs				
SS1f meas.from	<ul style="list-style-type: none"> • Not measurable • Fast Ref U3 • Fast Ref U4 	-	-	Displays which voltage channel frequency reference is used by "system set" voltage channel.
SS2f meas.from	<ul style="list-style-type: none"> • Not measurable • Fast Ref U4 	-	-	Displays if U4 channel frequency reference is measurable or not when the channel has been set to "system set" mode.

4.3 General menu

The *General* menu consists of basic settings and indications of the device. Additionally, the all activated functions and their status are displayed in the *Protection*, *Control* and *Monitor* profiles.

Table. 4.3 - 27. The *General* menu read-only parameters

Name	Description
Serial number	The unique serial number identification of the unit.
Firmware version	The firmware software version of the unit.
Hardware configuration	The order code identification of the unit.
System phase rotating order at the moment	The selected system phase rotating order. Can be changed with parameter "System phase rotating order".
UTC time	The UTC time value which the device's clock uses.

Table. 4.3 - 28. Parameters and indications in the *General* menu.

4.4 Protection functions

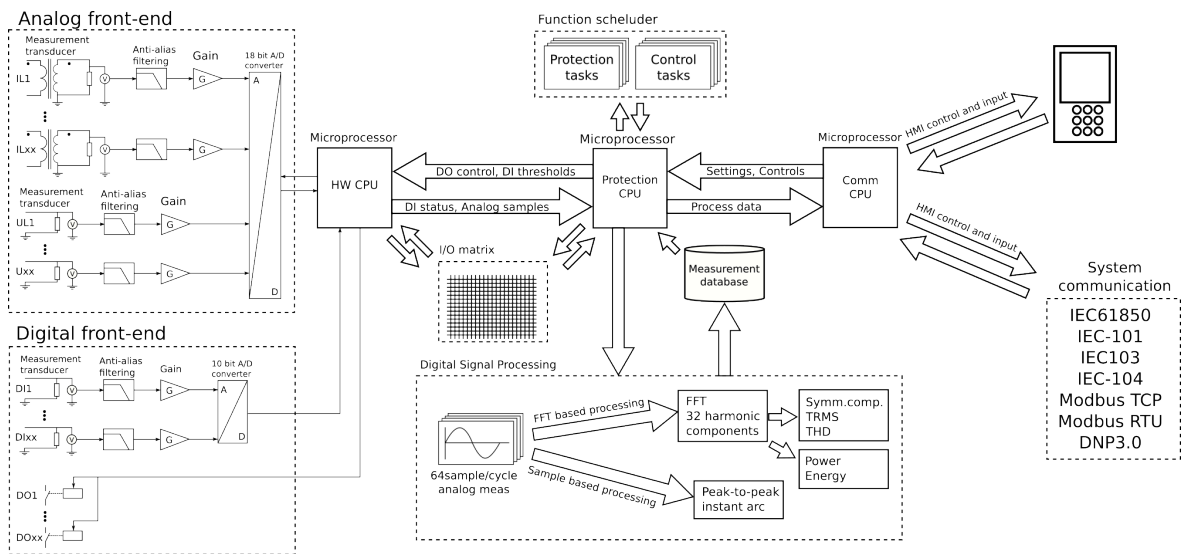

4.4.1 General properties of a protection function

The following flowchart describes the basic structure of any protection function. The basic structure is composed of analog measurement values being compared to the pick-up values and operating time delay characteristics.

The protection function is run in a completely digital environment with a protection CPU microprocessor which also processes the analog signals transformed into the digital form.

Figure. 4.4.1 - 60. Principle diagram of the protection device platform.

In the following chapters the common functionalities of protection functions are described. If a protection function deviates from this basic structure, the difference is described in the corresponding chapter of the manual.

Pick-up

The X_{set} parameter defines the pick-up level of the function, and this in turn defines the maximum or minimum allowed measured magnitude (in per unit, absolute or percentage value) before the function takes action. The function constantly calculates the ratio between the pick-up parameter set by the user and the measured magnitude (X_m). The reset ratio of 97 % is built into the function and is always relative to the X_{set} value. If a function's pick-up characteristics vary from this description, they are defined in the function section in the manual.

Figure. 4.4.1 - 61. Pick up and reset.

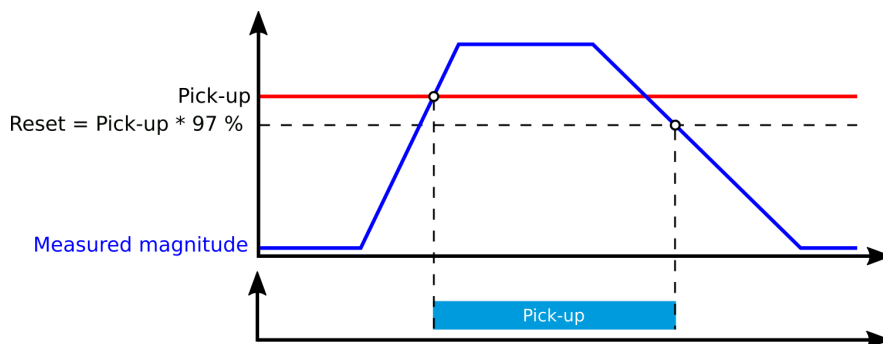

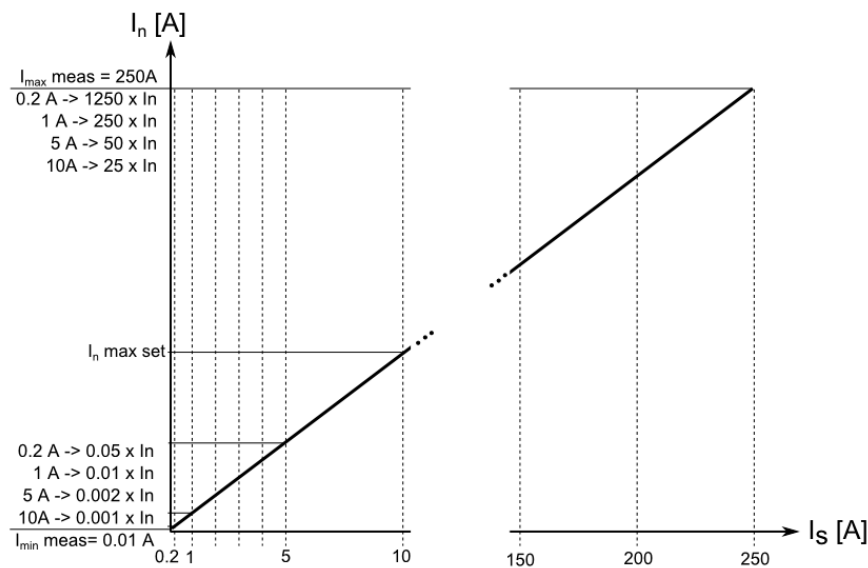

Figure. 4.4.1 - 62. Measurement range in relation to the nominal current.

The I_n magnitude refers to the user set nominal current which can range from 0.2...10 A, typically 0.2 A, 1A or 5 A. With its own current measurement card, the device will measure secondary currents from 0.001 A up to 250 A. To this relation the pick-up setting in secondary amperes will vary.

Function blocking

The blocking signals are checked in the beginning of each program cycle. A blocking signal is received from the blocking matrix for the function dedicated input. If the blocking signal is not active when the pick-up element is activated, a START signal is generated and the function proceeds to the time characteristics calculation.

If the blocking signal is active when pick-up element is activated, a BLOCKED signal is generated and the function will not process the situation further. Blocking signal will reset an active START signal and the release time characteristics are processed similarly to when the pick-up element is reset.

The blocking of the function causes a time stamped blocking event with information of the startup current values and its fault type to be issued.

The blocking inputs users can set are binary signals from the system. The blocking input signal needs to reach the device minimum of 5 ms before the set operating delay has passed in order for the blocking to activate in time.

Operating time characteristics

Three basic modes are available for delaying function operation:

- Instant operation: activates the trip signal simultaneously with the start signal with no additional time delay.
- Definite time operation (DT): activates the trip signal after a user-defined time delay regardless of the magnitude of the measured value(s) as long as the pick-up element is active.
- Inverse definite minimum time (IDMT): activates the trip signal after a time which is in relation to the set pick-up value and the measured value.

Both IEC and IEEE/ANSI standard characteristics as well as user settable parameters are available for the IDMT operation. Please note that in the IDMT mode *Definite (Min) operating time delay* also determines the minimum time for protection tripping (see the figure below). If this function is not desired the parameter should be set to 0 seconds.

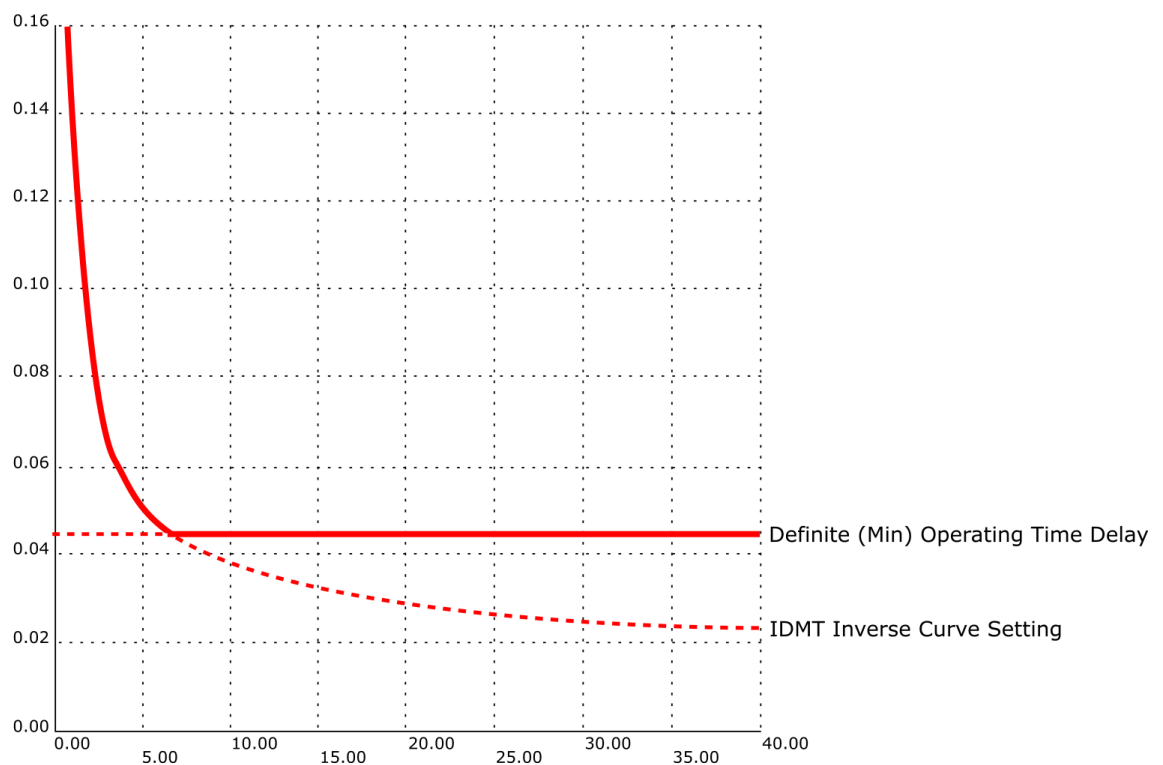

Figure. 4.4.1 - 63. Operating time delay: *Definite (Min) operating time delay* and the minimum for tripping.

Table. 4.4.1 - 30. Operating time characteristics setting parameters (general).

Name	Range	Step	Default	Description
Delay type	<ul style="list-style-type: none"> DT IDMT 	-	DT	Selects the delay type for the time counter. The selection is made between "Inverse definite minimum time" (IDMT) and "Definite time operation" (DT) characteristics.
Definite (min) operating time delay	0.000...1800.000s	0.005s	0.040s	<p>When the "Delay type" parameter is set to "DT", this parameter acts as the expected operating time for the protection function.</p> <p>When set to 0 s, the stage operates instantaneously without any additional delay. When the parameter is set to 0.005...1800 s, the stage operates as independent delayed.</p> <p>When the "Delay type" parameter has been set to "IDMT", this parameter can be used to determine the minimum operating time for the protection function. Example of this is presented in the figure above.</p>

Non-standard delay characteristics

In addition to the previously mentioned delay characteristics, some functions also have delay characteristics that deviate from the IEC or IEEE standards. These functions are the following:

- non-directional overcurrent stages
- non-directional earth fault stages
- directional overcurrent stages
- directional earth fault stages.

The setting parameters and their ranges are documented in the chapters of the respective function blocks.

Table. 4.4.1 - 31. Inverse definite minimum time formulas for nonstandard characteristics.

RI-type	RD-type
Used for getting the time grading with mechanical relays.	Mostly used in earth fault protection which grants selective tripping even in non-directional protection.
$t = \frac{k}{0.339 - 0.236 * \frac{I_{set}}{I_m}}$	$t = 5.8 - 1.35 * \ln \left(\frac{I_m}{k * I_{set}} \right)$
<p> <i>t</i> = Operation delay (s) <i>k</i> = Time dial setting <i>I_m</i> = Measured maximum current <i>I_{set}</i> = Pick-up setting </p>	<p> <i>t</i> = Operation delay (s) <i>k</i> = Time dial setting <i>I_m</i> = Measured maximum current <i>I_{set}</i> = Pick-up setting </p>

NOTICE!

When using RD-type and "k" has been set lower than 0.3 calculated operation time can be lower than 0 seconds with some measurement values. In these cases operation time will be instant.

When using the release delay option where the operating time counter is calculating the operating time during the release time, the function will not trip if the input signal is not activated again during the release time counting.

The behavior of the stages with different release time configurations are presented in the figures below.

Table. 4.4.1 - 32. Setting parameters for reset time characteristics.

Name	Range	Step	Default	Description
Delayed pick-up release	<ul style="list-style-type: none"> No Yes 	-	Yes	Resetting characteristics selection (either time-delayed or instant) after the pick-up element is released. If set to "Yes", the START signal is reset after a set release time delay.
Release time delay	0.000...150.000s	0.005s	0.06s	Resetting time. The time allowed between pick-ups if the pick-up has not led into a trip operation. If the "Delayed pick-up release" setting is set to "Yes", the START signal is held on for the duration of the timer.
Op.Time calculation reset after release time	<ul style="list-style-type: none"> No Yes 	-	Yes	Operating timer resetting characteristics selection. When set to "Yes", the operating time counter is reset after a set release time if the pick-up element is not activated during this time. When set to "No", the operating time counter is reset directly after the pick-up element is reset.
Continue time calculation during release time	<ul style="list-style-type: none"> No Yes 	-	No	Time calculation characteristics selection. If set to "Yes", the operating time counter continues until a set release time even if the pick-up element is reset.

Figure. 4.4.1 - 65. No delayed pick-up release.

Delayed pick-up release: Enabled
 Op.time calc reset after release time: Disabled
 Continue time calculation during release time: Disabled

Figure. 4.4.1 - 67. Delayed pick-up release, delay counter value is held during the release time.

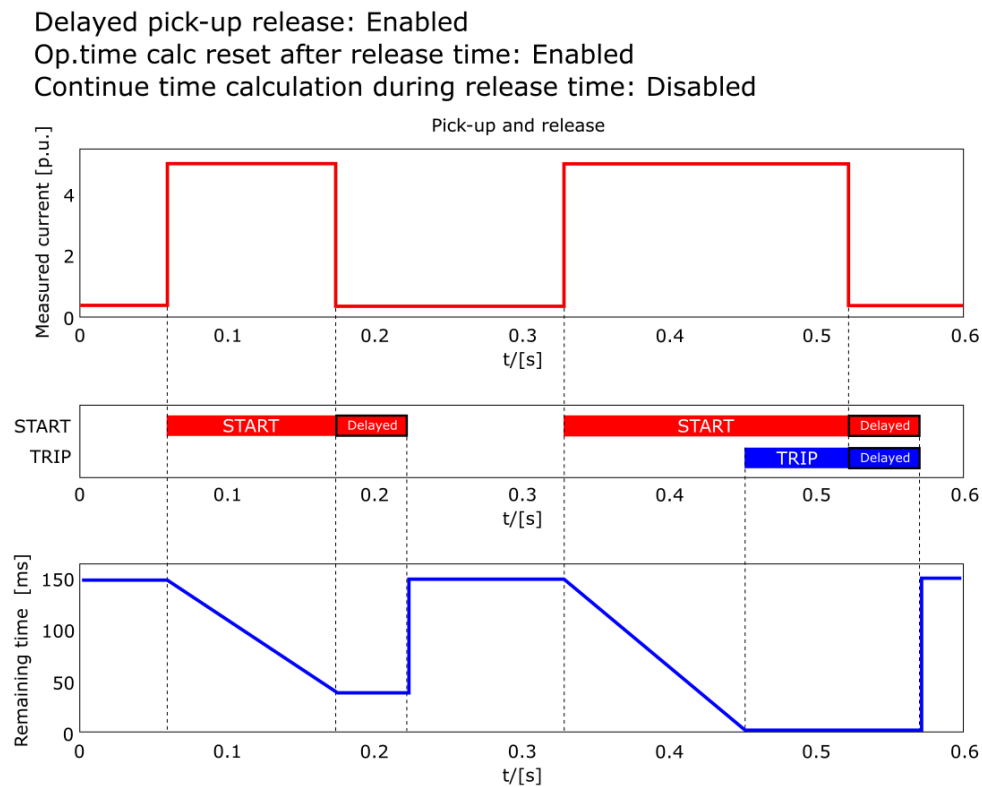

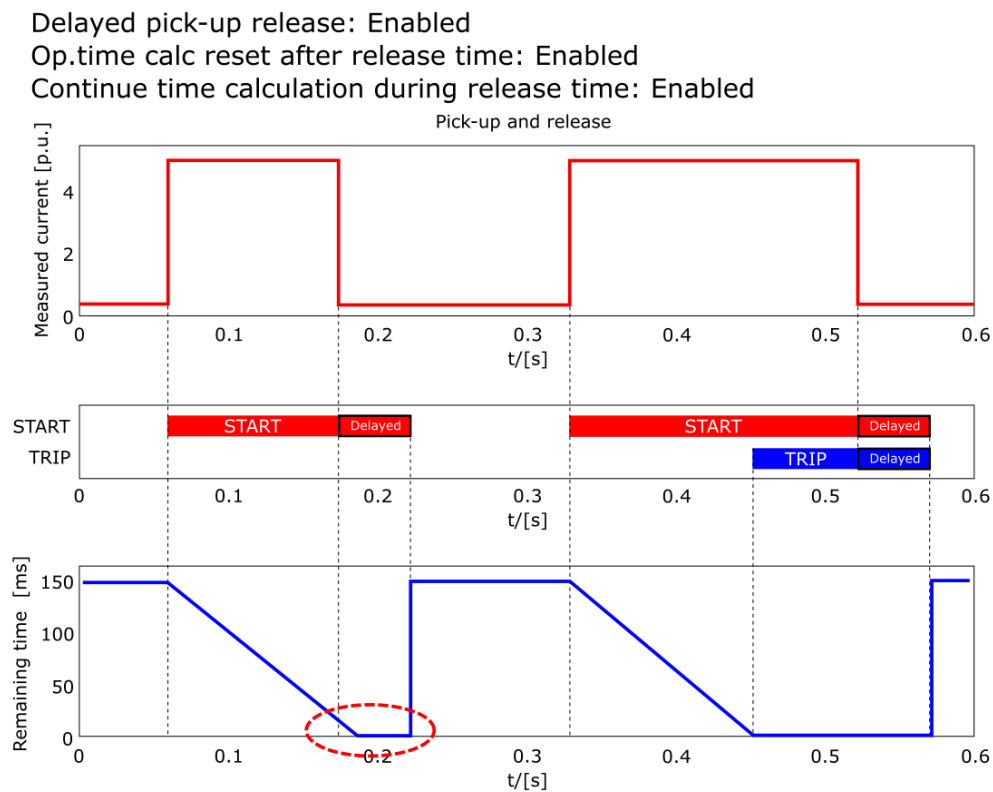

Figure. 4.4.1 - 68. Delayed pick-up release, delay counter value is decreasing during the release time.

Stage forcing

It is possible to test the logic, event processing and the operation of the device's logic by controlling the state of the protection functions manually without injecting any current into the device with stage forcing. To enable *Stage forcing* set the *Enable stage forcing* to ENABLED in the *General* menu. After this it is possible to control the status of a protection function (Normal, Start, Trip, Blocked etc.) in the *Info* page of the function.

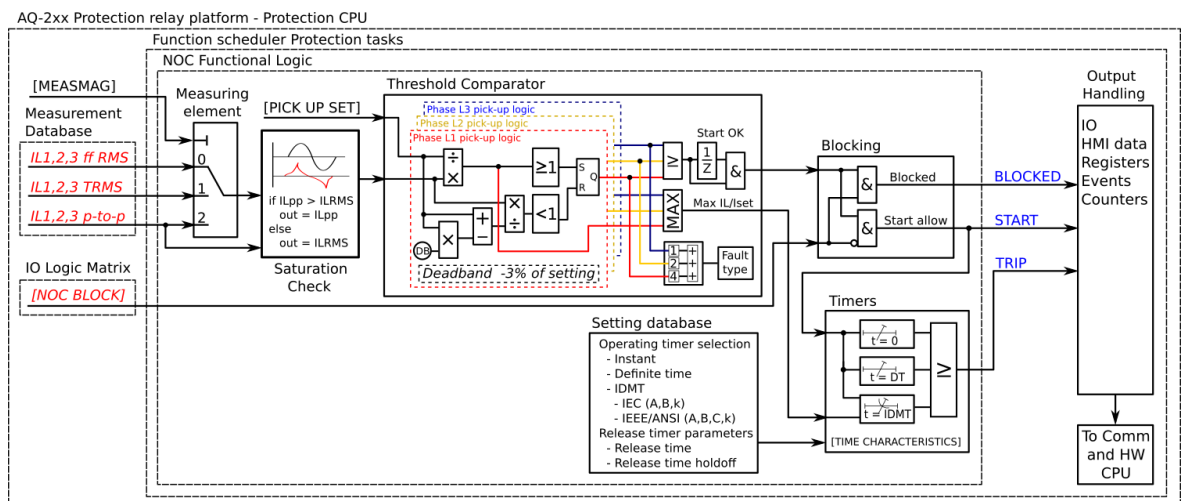

NOTICE!

When *Stage forcing* is enabled protection functions will also change state through user input. Injected currents/voltages also affect the behavior of the device. Regardless, it is recommended to disable *Stage Forcing* after testing has ended.

4.4.2 Non-directional overcurrent protection ($I>$; 50/51)

The non-directional overcurrent function is used for instant and time-delayed overcurrent and short-circuit protection. The function is used for one-phase, two-phase or three-phase overcurrent and short circuit protection. The function offers four (4) independent stages. The operating decisions are based on phase current magnitude, constantly measured by the function.

Figure. 4.4.2 - 69. Simplified function block diagram of the $I>$ function.

Measured input

The function block uses phase current measurement values. The user can select the monitored magnitude to be equal either to RMS values (fundamental frequency component), to TRMS values from the whole harmonic spectrum of 32 components, or to peak-to-peak values.

Table. 4.4.2 - 33. Measurement inputs of the $I>$ function.

Signal	Description	Time base
$I_{L1}RMS$	Fundamental frequency component of phase L1 (A) current measurement	5ms
$I_{L2}RMS$	Fundamental frequency component of phase L2 (B) current measurement	5ms
$I_{L3}RMS$	Fundamental frequency component of phase L3 (C) current measurement	5ms
$I_{L1}TRMS$	TRMS measurement of phase L1 (A) current	5ms

Signal	Description	Time base
I _{L2} TRMS	TRMS measurement of phase L2 (B) current	5ms
I _{L3} TRMS	TRMS measurement of phase L3 (C) current	5ms
I _{L1} PP	Peak-to-peak measurement of phase L1 (A) current	5ms
I _{L2} PP	Peak-to-peak measurement of phase L2 (B) current	5ms
I _{L3} PP	Peak-to-peak measurement of phase L3 (C) current	5ms

General settings

The following general settings define the general behavior of the function. These settings are static i.e. it is not possible to change them by editing the setting group.

Table. 4.4.2 - 34. General settings of the function.

Name	Range	Default	Description
Setting control from comm bus	<ul style="list-style-type: none"> Disabled Allowed 	<ul style="list-style-type: none"> Disabled 	Activating this parameter allows changing the pick-up level of the protection stage via SCADA.

Pick-up settings

The I_{set} setting parameter controls the pick-up of the $I>$ function. This defines the maximum allowed measured current before action from the function. The function constantly calculates the ratio between the I_{set} and the measured magnitude (I_m) for each of the three phases. The reset ratio of 97 % is built into the function and is always relative to the I_{set} value. The setting value is common for all measured phases, and when the I_m exceeds the I_{set} value (in single, dual or all phases) it triggers the pick-up operation of the function.

Setting group selection controls the operating characteristics of the function, i.e. the user or user-defined logic can change function parameters while the function is running.

Table. 4.4.2 - 35. Pick-up settings.

Name	Range	Step	Default	Description
I_{set}	$0.10 \dots 50.00 \times I_n$	$0.01 \times I_n$	$1.20 \times I_n$	Pick-up setting

Read-only parameters

The function's *Info* page displays useful, real-time information on the state of the protection function. It is accessed either through the device's HMI display, or through the setting tool software when it is connected to the device and its Live Edit mode is active.

Table. 4.4.2 - 36. Information displayed by the function.

Name	Range	Step	Description
$I>$ condition	<ul style="list-style-type: none"> Normal Start Trip Blocked 	-	Displays status of the protection function.
$I>$ phases condition	<ul style="list-style-type: none"> Normal Start A Start B Start C Trip A Trip B Trip C Start AB Start BC Start CA Start ABC Trip AB Trip BC Trip CA Trip ABC 	-	Displays the status of phases individually.
Expected operating time	$0.000 \dots 1800.000s$	$0.005s$	Displays the expected operating time when a fault occurs. When IDMT mode is used, the expected operating time depends on the measured highest phase current value. If the measured current changes during a fault, the expected operating time changes accordingly.
Time remaining to trip	$-1800.000 \dots 1800.000s$	$0.005s$	When the function has detected a fault and counts down time towards a trip, this displays how much time is left before tripping occurs.

Name	Range	Step	Description
I_{meas}/I_{set} at the moment	0.00...1250.00	0.01	The ratio between the highest measured phase current and the pick-up value.

Function blocking

The block signal is checked in the beginning of each program cycle. The blocking signal is received from the blocking matrix in the function's dedicated input. Additionally, the function includes an internal inrush harmonic blocking option which is applied according to the parameters set by the user. If the blocking signal is not activated when the pick-up element activates, a START signal is generated and the function proceeds to the time characteristics calculation.

Table. 4.4.2 - 37. Internal inrush harmonic blocking settings.

Name	Range	Step	Default	Description
Inrush harmonic blocking (internal-only trip)	<ul style="list-style-type: none"> No Yes 	-	<ul style="list-style-type: none"> No 	Enables and disables the 2 nd harmonic blocking.
2 nd harmonic blocking limit (I_{harm}/I_{fund})	0.10...50.00% I_{fund}	0.01% I_{fund}	0.01% I_{fund}	Defines the limit of the 2 nd harmonic blocking.

If the blocking signal is active when the pick-up element activates, a BLOCKED signal is generated and the function does not process the situation further. If the START function has been activated before the blocking signal, it resets and the release time characteristics are processed similarly to when the pick-up signal is reset.

The variables the user can set are binary signals from the system. The blocking signal needs to reach the device minimum of 5 ms before the set operating delay has passed in order for the blocking to activate in time.

Operating time characteristics for trip and reset

This function supports definite time delay (DT) and inverse definite minimum time delay (IDMT). For detailed information on these delay types please refer to the chapter ["General properties of a protection function"](#) and its section ["Operating time characteristics for trip and reset"](#).

Events and registers

The non-directional overcurrent function (abbreviated "NOC" in event block names) generates events and registers from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

The function's output can be used for direct I/O controlling and user logic programming. The function also provides a resettable cumulative counter for the START, TRIP and BLOCKED events.

Table. 4.4.2 - 38. Event messages.

Event block name	Event names
NOC1...NOC4	Start ON
NOC1...NOC4	Start OFF

Event block name	Event names
NOC1...NOC4	Trip ON
NOC1...NOC4	Trip OFF
NOC1...NOC4	Block ON
NOC1...NOC4	Block OFF
NOC1...NOC4	Phase A Start ON
NOC1...NOC4	Phase A Start OFF
NOC1...NOC4	Phase B Start ON
NOC1...NOC4	Phase B Start OFF
NOC1...NOC4	Phase C Start ON
NOC1...NOC4	Phase C Start OFF
NOC1...NOC4	Phase A Trip ON
NOC1...NOC4	Phase A Trip OFF
NOC1...NOC4	Phase B Trip ON
NOC1...NOC4	Phase B Trip OFF
NOC1...NOC4	Phase C Trip ON
NOC1...NOC4	Phase C Trip OFF

The function registers its operation into the last twelve (12) time-stamped registers; this information is available for all provided instances separately. The register of the function records the ON event process data for START, TRIP or BLOCKED. The table below presents the structure of the function's register content.

Table. 4.4.2 - 39. Register content.

Name	Description

Pick-up settings

The I_{0set} setting parameter controls the the pick-up of the I0> function. This defines the maximum allowed measured current before action from the function. The function constantly calculates the ratio between the I_{0set} and the measured magnitude (I_m) for each of the three phases. The reset ratio of 97 % is built into the function and is always relative to the I_{0set} value. The setting value is common for all measured phases. When the I_m exceeds the I_{0set} value (in single, dual or all phases) it triggers the pick-up operation of the function.

Setting group selection controls the operating characteristics of the function, i.e. the user or user-defined logic can change function parameters while the function is running.

Table. 4.4.3 - 42. Pick-up settings.

Name	Range	Step	Default	Description
I_{0set}	$0.0001 \dots 40.00 \times I_n$	$0.0001 \times I_n$	$1.20 \times I_n$	Pick-up setting

Read-only parameters

The function's *Info* page displays useful, real-time information on the state of the protection function. It is accessed either through the device's HMI display, or through the setting tool software when it is connected to the device and its Live Edit mode is active.

Table. 4.4.3 - 43. Information displayed by the function.

Name	Range	Step	Description

Detected I0 angle	-360.00...360.00 deg	0.01 deg	Angle of I0 against reference. If phase voltages are available, positive sequence voltage angle is used as reference. If voltages are not available, positive sequence current angle is used as reference.
Detected fault type	<ul style="list-style-type: none"> • - • A-G-R • B-G-F • C-G-R • A-G-F • B-G-R • C-G-F 	-	Displays the detected fault type and direction of previous fault. "A/B/C" stand for one of the three phases. "G" stands for "ground". "F" stands for "forward" direction and "R" stands for "reverse" direction.
Expected operating time	-1800.000...1800.000 s	0.005 s	Displays the expected operating time when a fault occurs. When IDMT mode is used, the expected operating time depends on the measured current value. If the measured current changes during a fault, the expected operating time changes accordingly.
Time remaining to trip	0.000...1800.000 s	0.005 s	When the function has detected a fault and counts down time towards a trip, this displays how much time is left before tripping occurs.
I _{meas} /I _{set} at the moment	0.00...1250.00	0.01	The ratio between the measured current and the pick-up value.

Function blocking

The block signal is checked in the beginning of each program cycle. The blocking signal is received from the blocking matrix in the function's dedicated input. Additionally, the function includes an internal inrush harmonic blocking option which is applied according to the parameters set by the user. If the blocking signal is not activated when the pick-up element activates, a START signal is generated and the function proceeds to the time characteristics calculation.

Table. 4.4.3 - 44. Internal inrush harmonic blocking settings.

Name	Range	Step	Default	Description
Inrush harmonic blocking (internal-only trip)	<ul style="list-style-type: none"> • No • Yes 	-	No	2 nd harmonic blocking enable/disable
2 nd harmonic block limit (I _{harm} / I _{fund})	0.10...50.00%I _{fund}	0.01%I _{fund}	0.01%I _{fund}	2 nd harmonic blocking limit

If the blocking signal is active when the pick-up element activates, a BLOCKED signal is generated and the function does not process the situation further. If the START function has been activated before the blocking signal, it resets and processes the release time characteristics similarly to when the pick-up signal is reset.

The variables the user can set are binary signals from the system. The blocking signal needs to reach the device minimum of 5 ms before the set operating delay has passed in order for the blocking to activate in time.

Operating time characteristics for trip and reset

This function supports definite time delay (DT) and inverse definite minimum time delay (IDMT). For detailed information on these delay types please refer to the chapter "[General properties of a protection function](#)" and its section "[Operating time characteristics for trip and reset](#)".

Events and registers

The non-directional earth fault function (abbreviated "NEF" in event block names) generates events and registers from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

The function's outputs can be used for direct I/O controlling and user logic programming. The function also provides a resettable cumulative counter for the START, TRIP and BLOCKED events.

The function offers four (4) independent stages; the events are segregated for each stage operation.

Table. 4.4.3 - 45. Event messages.

Event block name	Event names
NEF1...NEF4	Start ON
NEF1...NEF4	Start OFF
NEF1...NEF4	Trip ON
NEF1...NEF4	Trip OFF
NEF1...NEF4	Block ON
NEF1...NEF4	Block OFF

The function registers its operation into the last twelve (12) time-stamped registers. The register of the function records the ON event process data for START, TRIP or BLOCKED. The table below presents the structure of the function's register content.

Table. 4.4.3 - 46. Register content.

Name	Description

4.4.4 Negative sequence overcurrent/ phase current reversal/ current unbalance protection (I2>; 46/46R/46L)

The current unbalance function is used for instant and time-delayed unbalanced network protection and for detecting broken conductors. The number of stages in the function depends on the device model. The operating decisions are based on negative and positive sequence current magnitudes which the function constantly measures. In the broken conductor mode (I2/I1) the minimum allowed loading current is also monitored in the phase current magnitudes.

There are two possible operating modes available: the I2 mode monitors the negative sequence current, while the I2/I1 mode monitors the ratio between the negative sequence current and the positive sequence current. The device calculates the symmetrical component magnitudes in use from the phase current inputs I_{L1} , I_{L2} and I_{L3} . The zero sequence current is also recorded into the registers as well as the angles of the positive, negative and zero sequence currents in order to better verify any fault cases.

Figure. 4.4.4 - 71. Simplified function block diagram of the I2> function.

Measured input

The function block uses positive and negative sequence currents calculated from the phase current measurement channels. In the broken conductor mode (I2/I1) the function also uses fundamental frequency component of all phase currents to check the minimum current. Zero sequence and component sequence angles are used for fault registering and for fault analysis processing.

Table. 4.4.4 - 47. Measurement inputs of the I2> function.

Signal	Description	Time base
I1	Positive sequence current magnitude	5 ms
I2	Negative sequence current magnitude	5 ms
Iz	Zero sequence current magnitude	5 ms

Signal	Description	Time base
I1 ANG	Positive sequence current angle	5 ms
I2 ANG	Negative sequence current angle	5 ms
IZ ANG	Zero sequence current angle	5 ms
I _{L1} RMS	Fundamental frequency component of phase L1 (A) current measurement	5 ms
I _{L2} RMS	Fundamental frequency component of phase L2 (B) current measurement	5 ms
I _{L3} RMS	Fundamental frequency component of phase L3 (C) current measurement	5 ms

General settings

The following general settings define the general behavior of the function. These settings are static i.e. it is not possible to change them by editing the setting group.

Table. 4.4.4 - 48. General settings of the function.

Name	Range	Default	Description
I2> force status to	<ul style="list-style-type: none"> Normal Start Trip Blocked 	Normal	Force the status of the function. Visible only when <i>Enable stage forcing</i> parameter is enabled in <i>General</i> menu.
Measurement side	<ul style="list-style-type: none"> Side 1 Side 2 	Side 1	Defines which current measurement module is used by the function. Visible if the unit has more than one current measurement module.
Measured magnitude	<ul style="list-style-type: none"> I2pu I2/I1 	I2pu	Defines whether the ratio between the positive and the negative sequence currents are supervised or whether only the negative sequence is used in detecting unbalance.

Pick-up settings

The setting parameters I_{2set} and $I_{2/I1set}$ control the the pick-up of the I2> function. They define the maximum allowed measured negative sequence current or the negative/positive sequence current ratio before action from the function. The function constantly calculates the ratio between the I_{set} and the measured magnitude (I_m). The reset ratio of 97 % is built into the function and is always relative to the I_{xset} value. The reset ratio is the same for both modes.

Setting group selection controls the operating characteristics of the function, i.e. the user or user-defined logic can change function parameters while the function is running.

Table. 4.4.4 - 49. Pick-up settings.

Name	Range	Step	Default	Description
I2set	0.01...40.00×I _n	0.01×I _n	0.2×I _n	Pick-up setting for I2 mode
I2/I1set	1...200%	0.01%	20%	Pick-up setting for I2/I1 mode

Read-only parameters

The function's *Info* page displays useful, real-time information on the state of the protection function. It is accessed either through the device's HMI display, or through the setting tool software when it is connected to the device and its Live Edit mode is active.

Table. 4.4.4 - 50. Information displayed by the function.

Name	Range	Description
I2> condition	Normal Start Trip Blocked	Displays the status of the protection function.
I2> I2I1 relation	0.00...100 000.00	Ratio between the negative sequence current and positive sequence current.
I2 meas / I2 set	0.00...100 000.00	Ratio between measured negative sequence current and the pick-up value.
Expected operating time	0.000...1800.000s	Displays the expected operating time when a fault occurs. When IDMT mode is used, the expected operating time depends on the measured highest phase current value. If the measured current changes during a fault, the expected operating time changes accordingly.
Time remaining to trip	-1800.000...1800.000s	When the function has detected a fault and counts down time towards a trip, this displays how much time is left before tripping occurs.

Function blocking

The block signal is checked in the beginning of each program cycle. The blocking signal is received from the blocking matrix in the function's dedicated input. If the blocking signal is not activated when the pick-up element activates, a START signal is generated and the function proceeds to the time characteristics calculation.

If the blocking signal is active when the pick-up element activates, a BLOCKED signal is generated and the function does not process the situation further. If the START function has been activated before the blocking signal, it resets and processes the release time characteristics similarly to when the pick-up signal is reset.

The variables the user can set are binary signals from the system. The blocking signal needs to reach the device minimum of 5 ms before the set operating delay has passed in order for the blocking to activate in time.

Operating time characteristics for trip and reset

The operating timers' behavior during a function can be set for TRIP signal and also for the release of the function in case the pick-up element is reset before the trip time has been reached. There are three basic operating modes available for the function:

- Instant operation: gives the TRIP signal with no additional time delay simultaneously with the start signal.
- Definite time operation (DT): gives the TRIP signal after a user-defined time delay regardless of the measured current as long as the current is above or below the I_{set} value and thus the pick-up element is active (independent time characteristics).
- Inverse definite minimum time (IDMT): gives the TRIP signal after a time which is in relation to the set pick-up value I_{set} and the measured current I_m (dependent time characteristics).

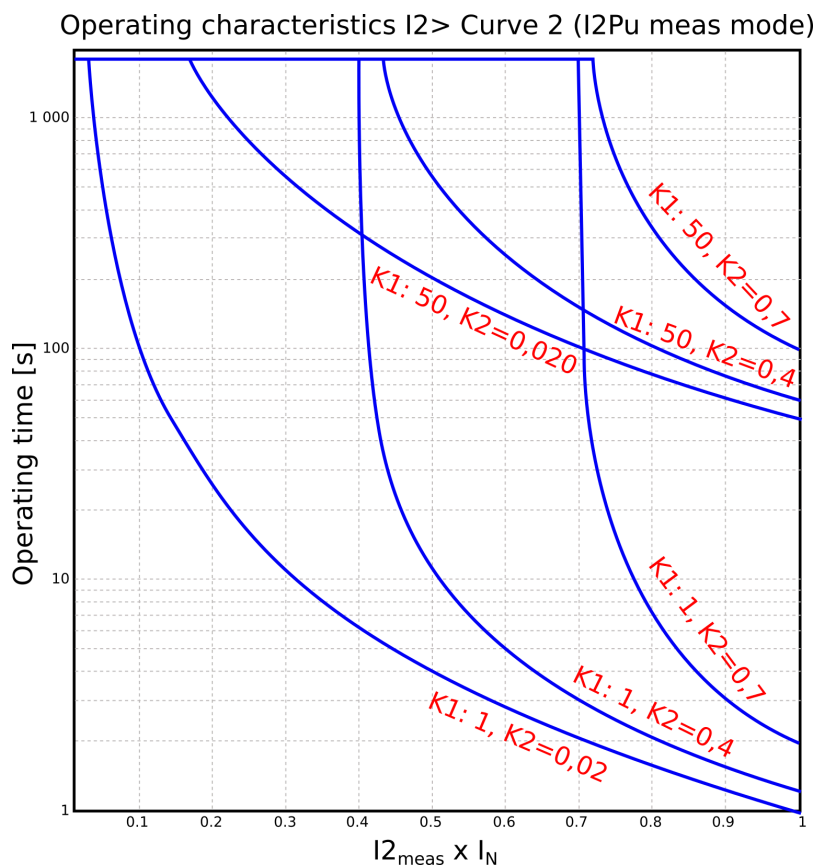

Both IEC and IEEE/ANSI standard characteristics as well as user settable parameters are available for the IDMT operation.

Unique to the current unbalance protection is the availability of the "Curve2" delay which follows the formula below:

$$t = \frac{k}{I_{2meas}^2 - I_{set}^2}$$

- t = Operating time
- I_{2meas} = Calculated negative sequence
- k = Constant k value (user settable delay multiplier)
- I_{set} = Pick-up setting of the function

Figure. 4.4.4 - 72. Operation characteristics curve for $I_2 >$ Curve2.

For a more detailed description on the time characteristics and their setting parameters, please refer to the "[General properties of a protection function](#)" chapter and its "[Operating time characteristics for trip and reset](#)" section.

Events and registers

The current unbalance function (abbreviated "CUB" in event block names) generates events and registers from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

The function's outputs can be used for direct I/O controlling and user logic programming. The function also provides a resettable cumulative counter for the START, TRIP and BLOCKED events.

The function offers four (4) independent stages; the events are segregated for each stage operation.

Table. 4.4.4 - 51. Event messages.

Event block name	Event names
CUB1...CUB4	Start ON
CUB1...CUB4	Start OFF
CUB1...CUB4	Trip ON
CUB1...CUB4	Trip OFF
CUB1...CUB4	Block ON
CUB1...CUB4	Block OFF

The function registers its operation into the last twelve (12) time-stamped registers. The register of the function records the ON event process data for START, TRIP or BLOCKED. The table below presents the structure of the function's register content.

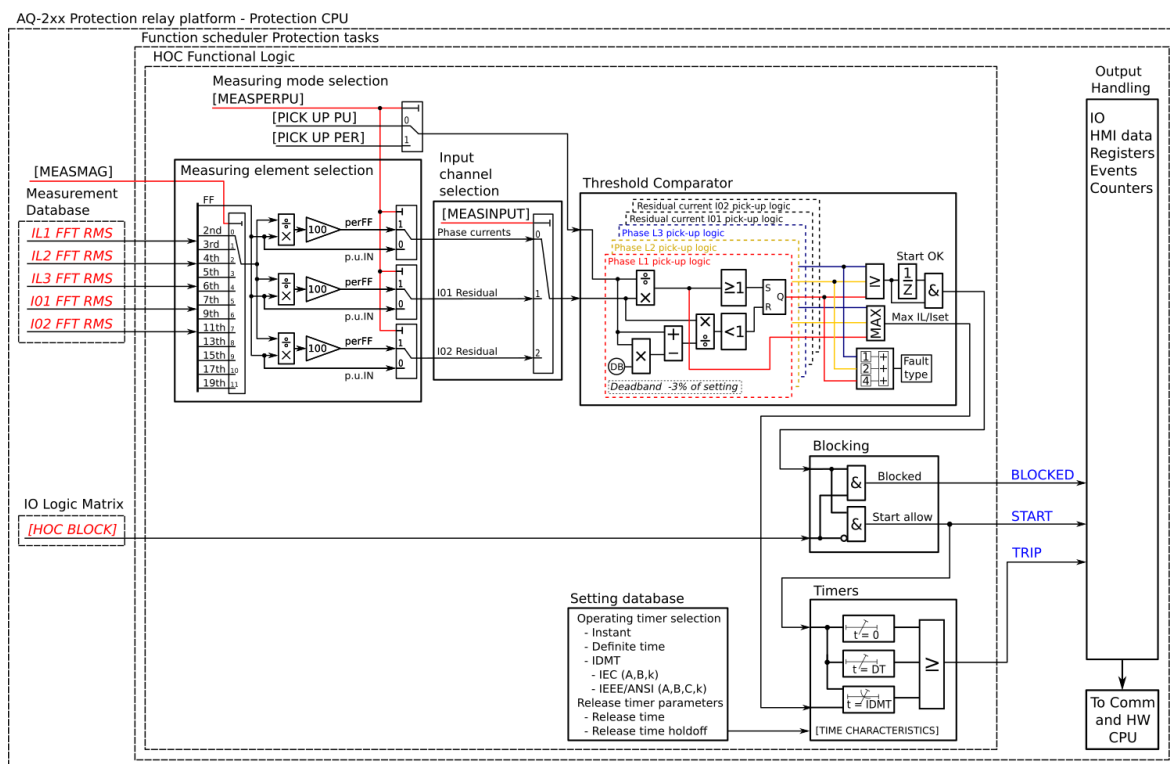

Table. 4.4.4 - 52. Register content.

Register	Description
Event	Event name
Date and time	dd.mm.yyyy hh:mm:ss.mss
Pre-trigger current	Start/Trip -20ms current
Fault current	Start/Trip current
Pre-fault current	Start -200ms current
Fault currents	I1, I2, IZ mag. and ang.
Trip time remaining	0 ms...1800s
Setting group in use	Setting group 1...8 active

4.4.5 Harmonic overcurrent protection (Ih>; 50H/51H/68H)

The harmonic overcurrent function is used for non-directional instant and time-delayed overcurrent detection and clearing. The number of stages in the function depends on the device model. The function constantly measures the selected harmonic component of the selected measurement channels, the value being either absolute value or relative to the RMS value.

Figure. 4.4.5 - 73. Simplified function block diagram of the Ih> function.

Measured input

The function block uses analog current measurement values from phase or residual currents. Each measurement input of the function block uses RMS (fundamental frequency component) values and harmonic components of the selected current input. The user can select the monitored magnitude to be equal to the per-unit RMS values of the harmonic component, or to the harmonic component percentage content compared to the RMS values.

Table. 4.4.5 - 53. Measurement inputs of the $I_{h>}$ function.

Signal	Description	Time base

Signal	Description	Time base
I ₀₂ FFT	<p>The magnitudes (RMS) of residual I₀₂ current components:</p> <ul style="list-style-type: none"> - Fundamental - 2nd harmonic - 3rd harmonic - 4th harmonic - 5th harmonic - 6th harmonic - 7th harmonic - 9th harmonic - 11th harmonic - 13th harmonic - 15th harmonic - 17th harmonic - 19th harmonic. 	5 ms

General settings

The function can be set to monitor the ratio between the measured harmonic and either the measured fundamental component or the per unit value of the harmonic current. The user must select the correct measurement input.

Table. 4.4.5 - 54. Operating mode selection settings.

Name	Range	Default	Description
Ih> force status to	<ul style="list-style-type: none"> • Normal • Start • Trip • Blocked 	Normal	Force the status of the function. Visible only when <i>Enable stage forcing</i> parameter is enabled in <i>General</i> menu.
Ih> measurement side	<ul style="list-style-type: none"> • Side 1 • Side 2 	Side 1	Defines which current measurement module is used by the function. Visible if the unit has more than one current measurement module.

Name	Range	Default	Description
Harmonic selection	<ul style="list-style-type: none"> • 2nd harmonic • 3rd harmonic • 4th harmonic • 5th harmonic • 6th harmonic • 7th harmonic • 9th harmonic • 11th harmonic • 13th harmonic • 15th harmonic • 17th harmonic • 19th harmonic 	2 nd harmonic	Selection of the monitored harmonic component.
Per unit or relative	<ul style="list-style-type: none"> • $\times I_n$ • I_h/IL 	$\times I_n$	Selection of the monitored harmonic mode. Either directly per unit $\times I_n$ or in relation to the fundamental frequency magnitude.
Measurement input	<ul style="list-style-type: none"> • IL1/IL2/IL3 • I01 • I02 	IL1/IL2/IL3	Selection of the measurement input (either phase current or residual current).

Pick-up settings

The setting parameter I_{hset} per unit or I_h/IL (depending on the selected operating mode) controls the pick-up of the $I_h >$ function. This defines the maximum allowed measured current before action from the function. The function constantly calculates the ratio between the I_{hset} per unit or I_h/IL and the measured magnitude (I_m) for each of the three phases. The reset ratio of 97 % is built into the function and is always relative to the I_{hset} per unit or I_h/IL value. The setting value is common for all measured phases, and when the I_m exceeds the I_{set} value (in single, dual or all phases) it triggers the pick-up operation of the function.

Setting group selection controls the operating characteristics of the function, i.e. the user or user-defined logic can change function parameters while the function is running.

Table. 4.4.5 - 55. Pick-up settings.

Name	Range	Step	Default	Description
I_{hset} pu	$0.05 \dots 2.00 \times I_n$	$0.01 \times I_n$	$0.20 \times I_n$	Pick-up setting (per unit monitoring)

Name	Range	Step	Default	Description
Ih/IL	5.00...200.00%	0.01%	20.00%	Pick-up setting (percentage monitoring)

Read-only parameters

The function's *Info* page displays useful, real-time information on the state of the protection function. It is accessed either through the device's HMI display, or through the setting tool software when it is connected to the device and its Live Edit mode is active.

Table. 4.4.5 - 56. Information displayed by the function.

Name	Range	Step	Description
Ih> condition	<ul style="list-style-type: none"> Normal Start Trip Blocked 	-	Displays the status of the protection function.
Ih meas/ Ih set now	0.00...100000.00I _m /I _{set}	0.01I _m /I _{set}	The ratio between the monitored residual current and the pick-up value.
Expected operating time	0.000...1800.000s	0.005s	Displays the expected operating time when a fault occurs. When IDMT mode is used, the expected operating time depends on the measured voltage value. If the measured voltage changes during a fault, the expected operating time changes accordingly.
Time remaining to trip	-1800.000...1800.000s	0.005s	When the function has detected a fault and counts down time towards a trip, this displays how much time is left before tripping occurs.

Function blocking

The block signal is checked in the beginning of each program cycle. The blocking signal is received from the blocking matrix in the function's dedicated input. If the blocking signal is not activated when the pick-up element activates, a START signal is generated and the function proceeds to the time characteristics calculation.

If the blocking signal is active when the pick-up element activates, a BLOCKED signal is generated and the function does not process the situation further. If the START function has been activated before the blocking signal, it resets and the release time characteristics are processed similarly to when the pick-up signal is reset.

The variables the user can set are binary signals from the system. The blocking signal needs to reach the device minimum of 5 ms before the set operating delay has passed in order for the blocking to activate in time.

Operating time characteristics for trip and reset

This function supports definite time delay (DT) and inverse definite minimum time delay (IDMT). For detailed information on these delay types please refer to the chapter "[General properties of a protection function](#)" and its section "[Operating time characteristics for trip and reset](#)".

Events and registers

The harmonic overcurrent function (abbreviated "HOC" in event block names) generates events and registers from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

The function's outputs can be used for direct I/O controlling and user logic programming. The START signal can be used to block other stages; if the situation lasts longer, the TRIP signal can be used on other actions as time-delayed. The function also provides a resettable cumulative counter for the START, TRIP and BLOCKED events.

The function offers four (4) independent stages; the events are segregated for each stage operation.

Table. 4.4.5 - 57. Event description.

Event block name	Event names
HOC1...HOC4	Start ON
HOC1...HOC4	Start OFF
HOC1...HOC4	Trip ON
HOC1...HOC4	Trip OFF
HOC1...HOC4	Block ON
HOC1...HOC4	Block OFF

The function registers its operation into the last twelve (12) time-stamped registers. The register of the function records the ON event process data for START, TRIP or BLOCKED. The table below presents the structure of the function's register content.

Table. 4.4.5 - 58. Register content.

Register	Description
Date and time	dd.mm.yyyy hh:mm:ss.mss
Event	Event name
Fault type	L1-G...L1-L2-L3
Pre-trigger current	Start/Trip -20ms current
Fault current	Start/Trip current
Pre-fault current	Start -200ms current
Trip time remaining	0 ms...1800s
Setting group in use	Setting group 1...8 active

4.4.6 Circuit breaker failure protection (CBFP; 50BF/52BF)

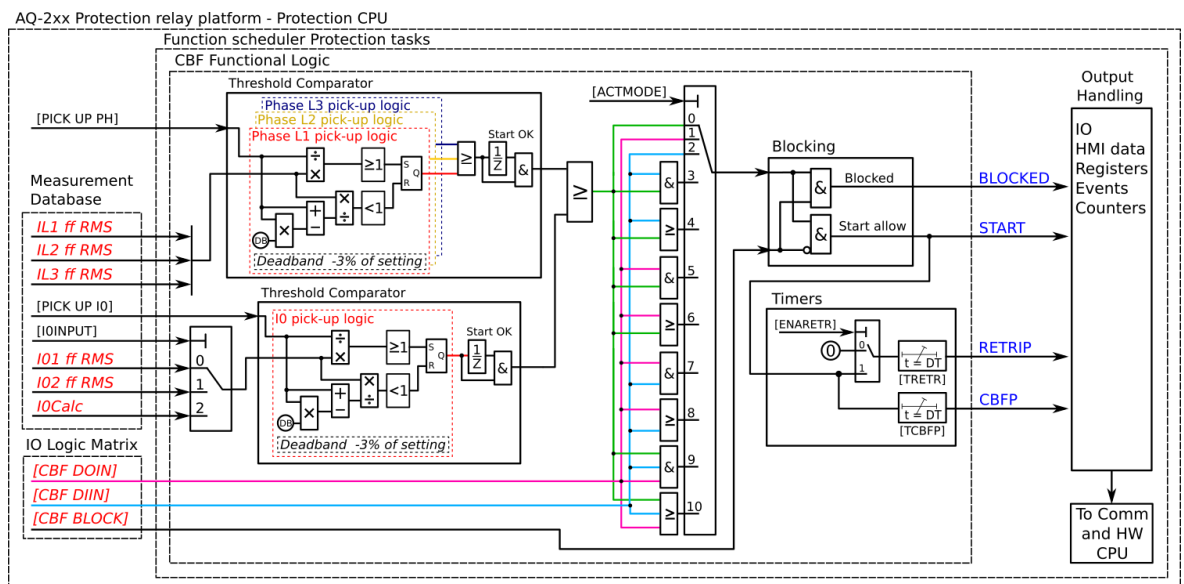

The circuit breaker failure protection function is used for monitoring the circuit breaker operation after it has received a TRIP signal. The function can also be used to retrip a failing breaker; if the retrip fails, an incoming feeder circuit breaker can be tripped by using the function's CBFP output. The retrip functionality can be disabled if the breaker does not have two trip coils.

The function can be triggered by the following:

- overcurrent (phase and residual)
- digital output monitor
- digital signal
- any combination of the above-mentioned triggers.

In the current-dependent mode the function constantly measures phase current magnitudes and the selected residual current. In the signal-dependent mode any of the device's binary signals (trips, starts, logical signals etc.) can be used to trigger the function. In the digital output-dependent mode the function monitors the status of the selected output relay control signal.

Figure. 4.4.6 - 74. Simplified function block diagram of the CBFP function.

Measured input

The function block uses fundamental frequency component of phase current and residual current measurement values. The user can select I01, I02 or the calculated I0 for the residual current measurement.

Table. 4.4.6 - 59. Measurement inputs of the CBFP function.

Signal	Description	Time base
$I_{L1}RMS$	Fundamental frequency component of phase L1 (A) current measurement	5ms
$I_{L2}RMS$	Fundamental frequency component of phase L2 (B) current measurement	5ms
$I_{L3}RMS$	Fundamental frequency component of phase L3 (C) current measurement	5ms
$I_{01}RMS$	Fundamental frequency component of residual input I_{01} measurement	5ms

Signal	Description	Time base
I_{02RMS}	Fundamental frequency component of residual input I_{02} measurement	5ms
I_{0Calc}	Calculated residual current from the phase current inputs	5ms

General settings

The following general settings define the general behavior of the function. These settings are static i.e. it is not possible to change them by editing the setting group.

Table. 4.4.6 - 60. CBFP monitoring signal definitions.

Name	Description
Signal in monitor	Defines which TRIP events of the used protection functions trigger the CBFP countdown. For the CBFP function to monitor the signals selected here, the "Operation mode selection" parameter must be set to a mode that includes signals (e.g. "Signals only", "Signals or DO", "Current and signals and DO").
Trip monitor	Defines which output relay of the used protection functions trigger the CBFP countdown. For the CBFP function to monitor the output relays selected here, the "Operation mode selection" parameter must be set to a mode that includes digital outputs (e.g. "DO only", "Current and DO", "Current or signals or DO").

Table. 4.4.6 - 61. General settings of the function.

Name	Range	Default	Description
CBFP force status to	<ul style="list-style-type: none"> Normal Start ReTrip CBFP Blocked 	Normal	Force the status of the function. Visible only when <i>Enable stage forcing</i> parameter is enabled in <i>General</i> menu.
Measurement side	<ul style="list-style-type: none"> Side 1 Side 2 	Side 1	Defines which current measurement module is used by the function.

Pick-up settings

The setting parameters I_{set} and I_{0set} control the pick-up and the activation of the current-dependent CBFP function. They define the minimum allowed measured current before action from the function. The function constantly calculates the ratio between the I_{set} or the I_{0set} and the measured magnitude (I_m) for each of the three phases and the selected residual current input. The reset ratio of 97 % is built into the function and is always relative to the I_{set} value. The setting value is common for all measured phases. When the I_m exceeds the I_{set} value (in single, dual or all phases) it triggers the pick-up operation of the function.

Setting group selection controls the operating characteristics of the function, i.e. the user or user-defined logic can change function parameters while the function is running.

Table. 4.4.6 - 62. Operating mode and input signals selection.

Name	Range	Step	Default	Description
I0Input	<ul style="list-style-type: none"> Not in use I01 I02 I0Calc 	-	Not in use	Selects the residual current monitoring source, which can be either from the two separate residual measurements (I01 and I02) or from the phase current's calculated residual current.
Actmode	<ul style="list-style-type: none"> Current only DO only Signals only Current and DO Current or DO Current and signals Current or signals Signals and DO Signals or DO Current or DO or signals Current and DO and Signals 	-	Current only	Selects the operating mode. The mode can be dependent on current measurement, binary signal status, output relay status ("DO"), or a combination of the three.

Table. 4.4.6 - 63. Pick-up settings.

Name	Range	Step	Default	Description
I _{set}	0.01...40.00×I _N	0.01×I _N	0.20×I _N	The pick-up threshold for the phase current measurement. This setting limit defines the upper limit for the phase current pick-up element.
I0 _{set}	0.005...40.000×I _N	0.001×I _N	1.200×I _N	The pick-up threshold for the residual current measurement. This setting limit defines the upper limit for the phase current pick-up element.

Read-only parameters

The function's *Info* page displays useful, real-time information on the state of the protection function. It is accessed either through the device's HMI display, or through the setting tool software when it is connected to the device and its Live Edit mode is active.

Table. 4.4.6 - 64. Information displayed by the function.

Name	Range	Description
CBFP condition	<ul style="list-style-type: none"> • Normal • Start • ReTrip • CBFP On • Blocked 	Displays status of the protection function.

Function blocking

The block signal is checked in the beginning of each program cycle. The blocking signal is received from the blocking matrix in the function's dedicated input. If the blocking signal is not activated when the pick-up element activates, a START signal is generated and the function proceeds to the time characteristics calculation.

If the blocking signal is active when the pick-up element activates, a BLOCKED signal is generated and the function does not process the situation further. If the START function has been activated before the blocking signal, it resets and processes the release time characteristics similarly to when the pick-up signal is reset.

The variables the user can set are binary signals from the system. The blocking signal needs to reach the device minimum of 5 ms before the set operating delay has passed in order for the blocking to activate in time.

Operating time characteristics

The operating timers' behavior during a function can be set depending on the application. The same pick-up signal starts both timers. When retrip is used the time grading should be set as follows: the sum of specific times (i.e. the retrip time, the expected operating time, and the pick-up conditions' release time) is shorter the set CBFP time. This way, when retripping another breaker coil clears the fault, any unnecessary function triggers are avoided.

The following table presents the setting parameters for the function's operating time characteristics.

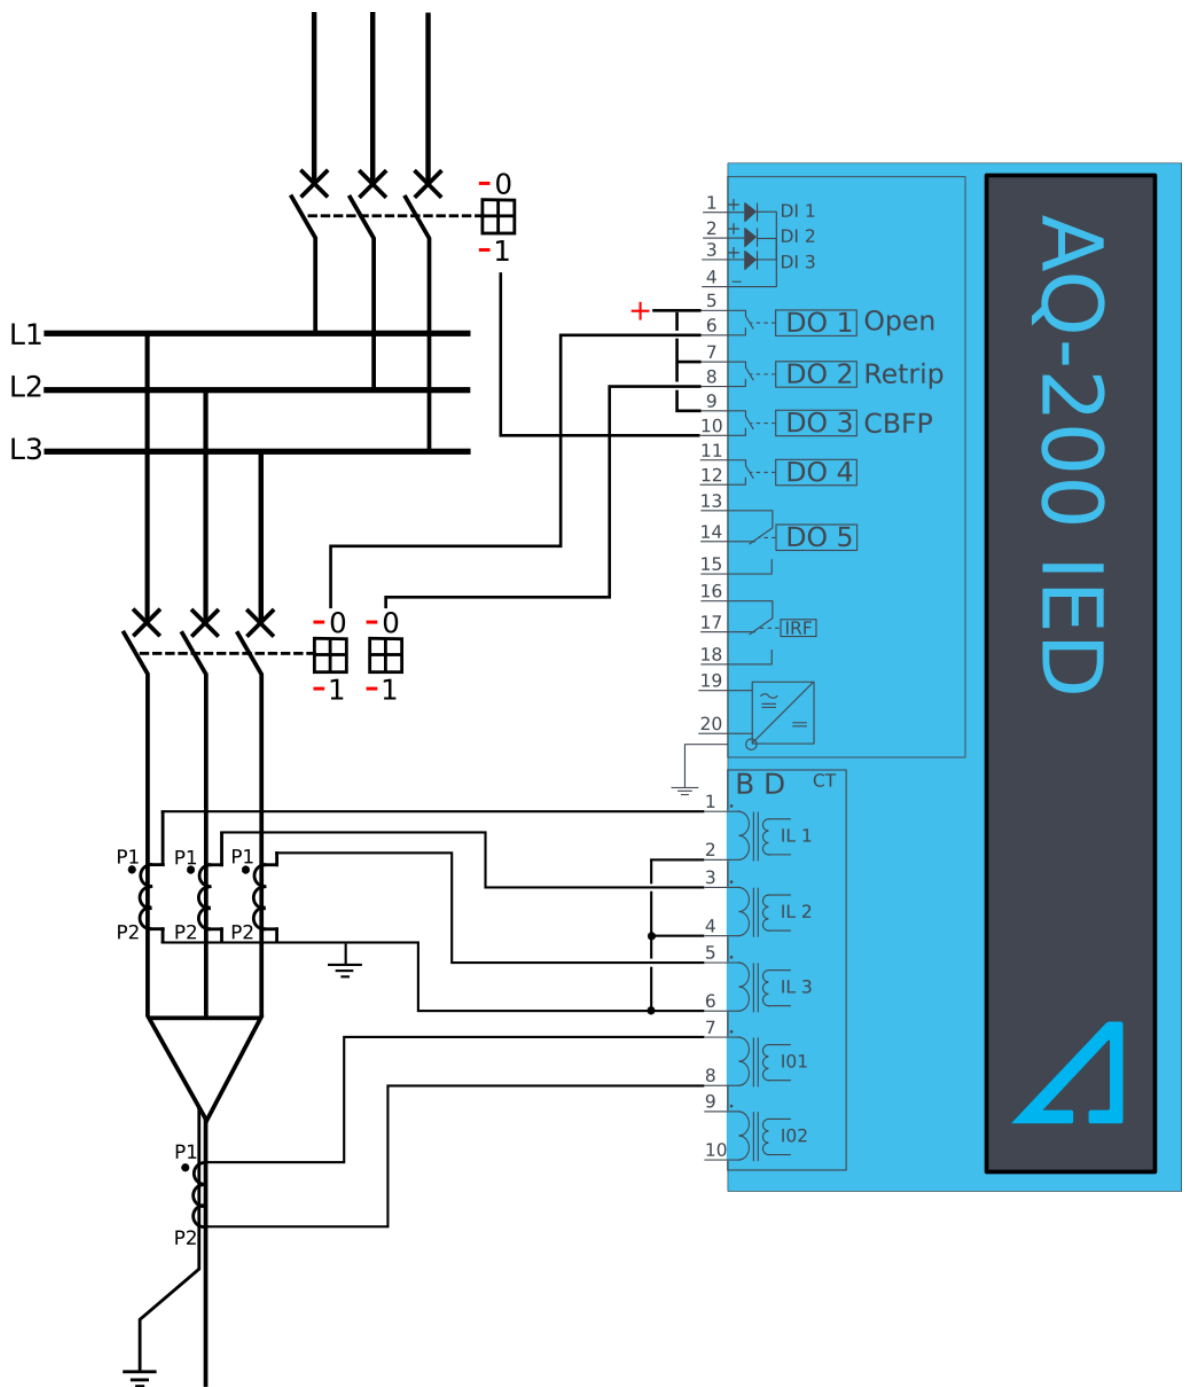

Table. 4.4.6 - 65. Setting parameters for operating time characteristics.

Name	Range	Step	Default	Description
Retrip	<ul style="list-style-type: none"> • No • Yes 	-	Yes	Retrip enabled or disabled. When the retrip is disabled, the output will not be visible and the TRetr setting parameter will not be available.
Retrip time delay	0.000...1800.000s	0.005s	0.100s	Retrip start the timer. This setting defines how long the starting condition has to last before a RETRIP signal is activated.
CBFP	0.000...1800.000s	0.005s	0.200s	CBFP starts the timer. This setting defines how long the starting condition has to last before the CBFP signal is activated.

The following figures present some typical cases of the CBFP function.

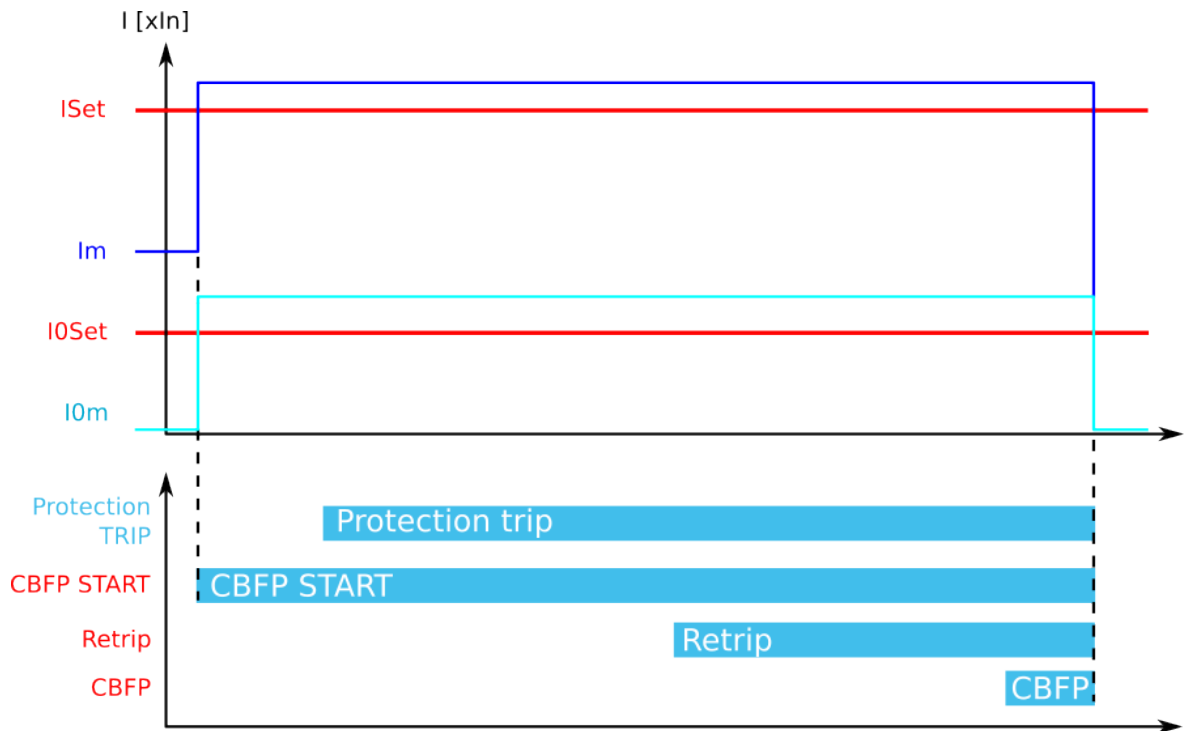

Trip, Retrip and CBFP in the device configuration

Figure. 4.4.6 - 75. Wiring diagram when Trip, Retrip and CBFP are configured to the device.

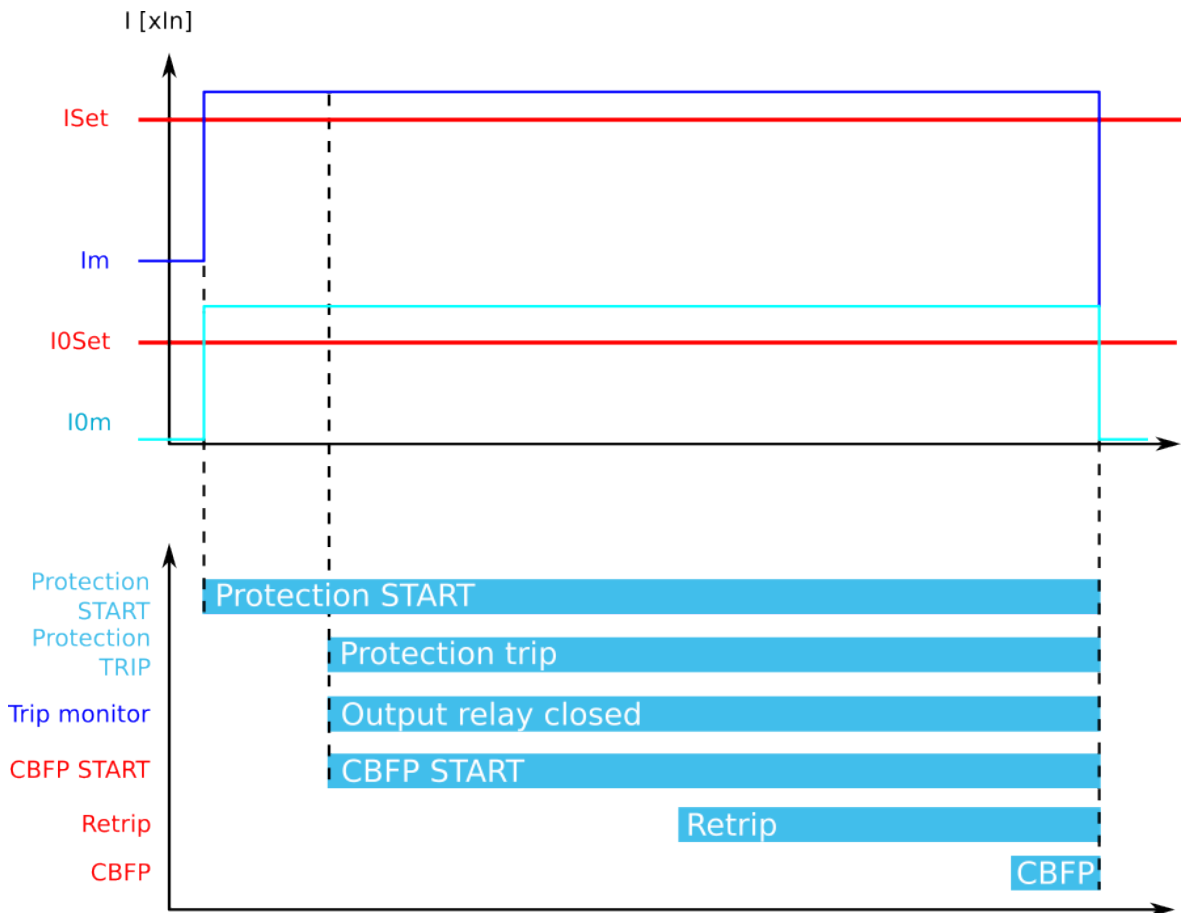

The retrip functionality can be used in applications whose circuit breaker has a retrip or a redundant trip coil available. The TRIP signal is normally wired to the breaker's trip coil from the device's trip output. The retrip is wired from its own device output contact in parallel with the circuit breaker's redundant trip coil. The CBFP signal is normally wired from its device output contact to the incoming feeder circuit breaker. Below are a few operational cases regarding the various applications.

Figure. 4.4.6 - 76. Retrip and CBFP when "Current" is the selected criterion.

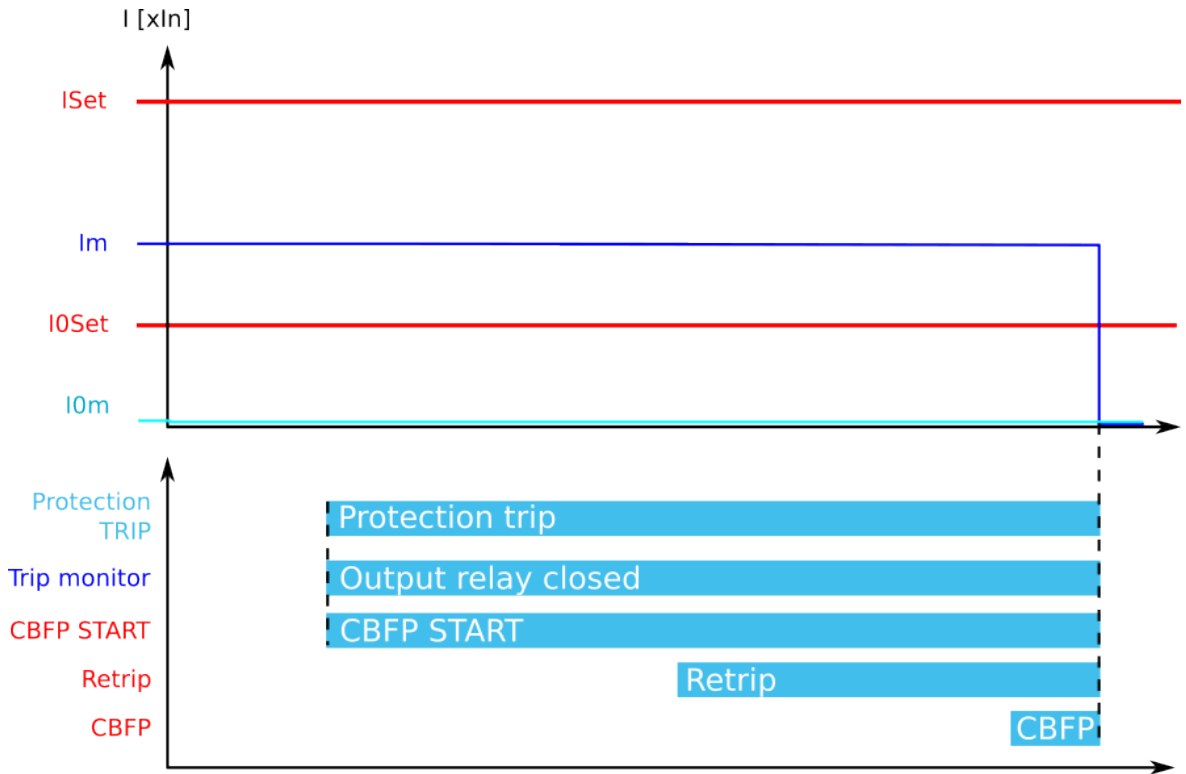

When the current threshold setting of I_{set} and/or I_{Oset} is exceeded, the current-based protection is activated and the counters for RETRIP and CBFP start calculating the set operating time. The tripping of the primary protection stage is not monitored in this configuration. Therefore, if the current is not reduced below the setting limit, a RETRIP signal is sent to the redundant trip coil. If the current is not reduced within the set time limit, the function also sends a CBFP signal to the incoming feeder breaker. If the primary protection function clears the fault, both counters (RETRIP and CBFP) are reset as soon as the measured current is below the threshold settings.

Figure. 4.4.6 - 77. Retrip and CBFP when "Current and DO" is the selected criterion.

When the current threshold setting of I_{set} and/or I_{Oset} is exceeded, the current-based protection is activated. At the same time, the counters for RETRIP and CBFP are halted until the monitored output contact is controlled (that is, until the primary protection operates). When the tripping signal reaches the primary protection stage, the RETRIP and CBFP counters start calculating the set operating time. The tripping of the primary protection stage is constantly monitored in this configuration. If the current is not reduced below the setting limit or the primary stage tripping signal is not reset, a RETRIP signal is sent to the redundant trip coil. If the retripping fails and the current is not reduced below the setting limit or the primary stage tripping signal is not reset, the function also sends a CBFP signal to the incoming feeder circuit breaker. If the primary protection function clears the fault, both counters (RETRIP and CBFP) are reset as soon as the measured current is below the threshold settings or the tripping signal is reset. This configuration allows the CBFP to be controlled with current-based functions alone, and other function trips can be excluded from the CBFP functionality.

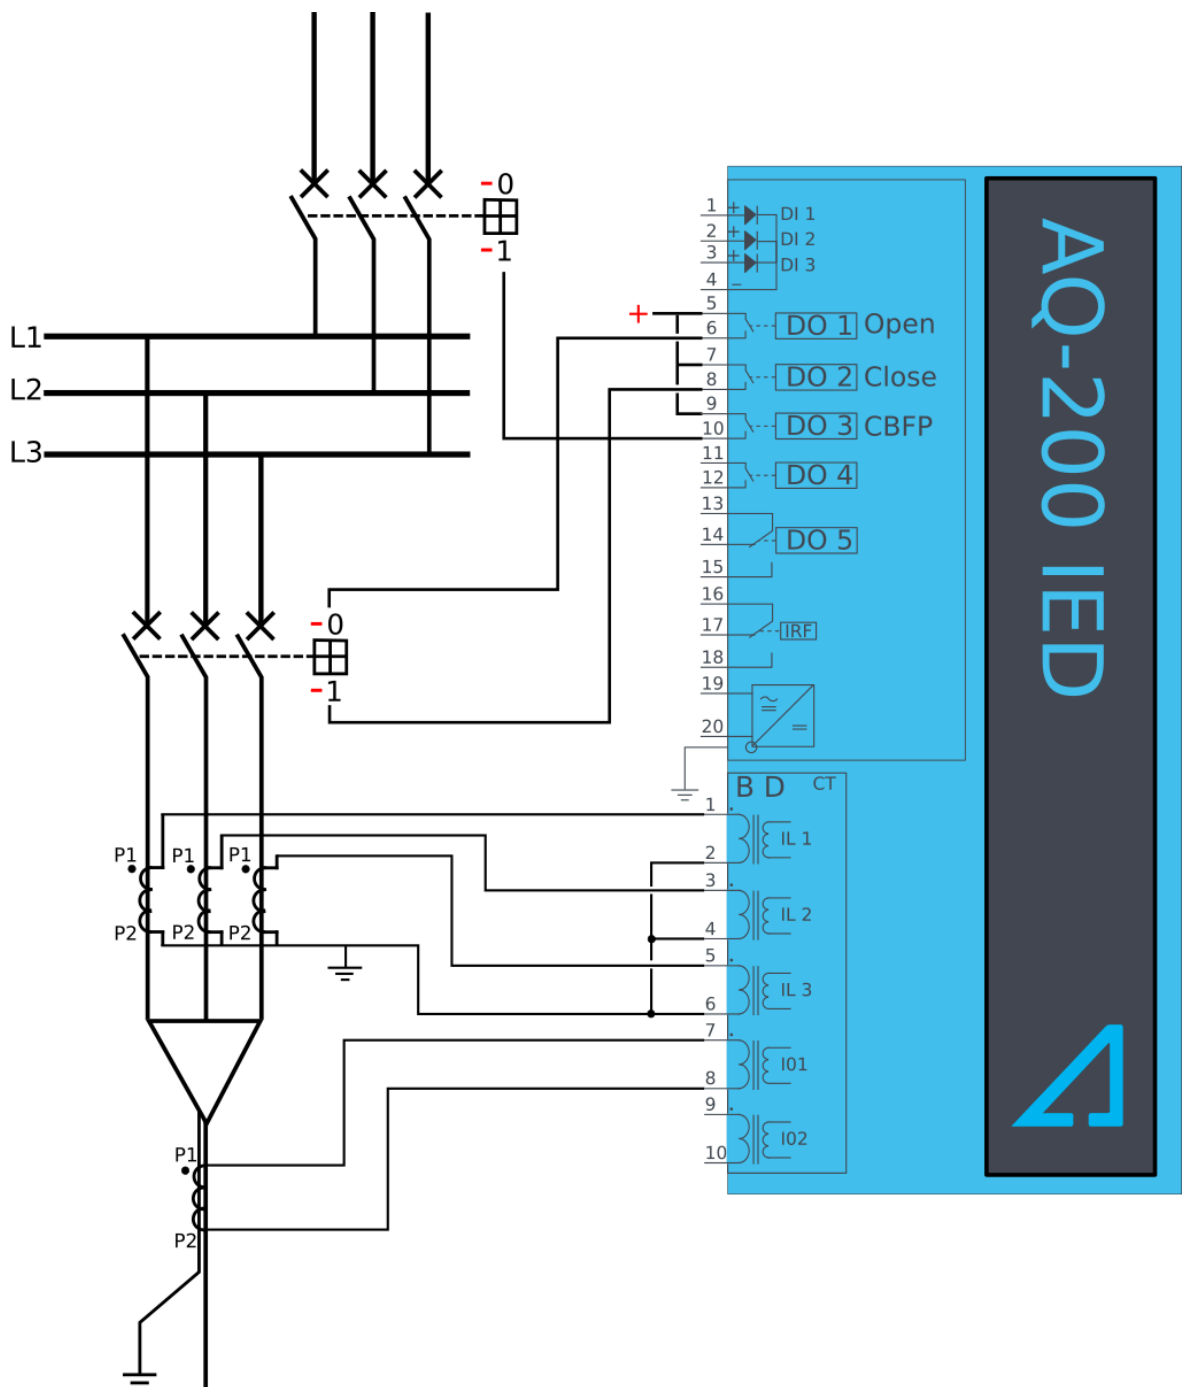

Figure. 4.4.6 - 78. Retrip and CBFP when "Current or DO" is the selected criterion.

When the current threshold setting of I_{Set} and/or I_{OSet} is exceeded, or the TRIP signal reaches the primary protection stage, the function starts counting down towards the RETRIP and CBFP signals. The tripping of the primary protection stage is constantly monitored in this configuration regardless of the current's status. The pick-up of the CBFP is active unless the current is reduced below the setting limit and the primary stage tripping signal is reset. If either of these conditions is met (i.e. the current is above the limit or the signal is active) for the duration of the set RETRIP time delay, a RETRIP signal is sent to the redundant trip coil. If either of the conditions is active for the duration of the set CBFP time delay, a CBFP signal is sent to the incoming feeder circuit breaker. If the primary protection function clears the fault, both counters (RETRIP and CBFP) are reset as soon as the measured current is below the threshold settings and the tripping signal is reset. This configuration allows the CBFP to be controlled with current-based functions alone, with added security from current monitoring. Other function trips can also be included in the CBFP functionality.

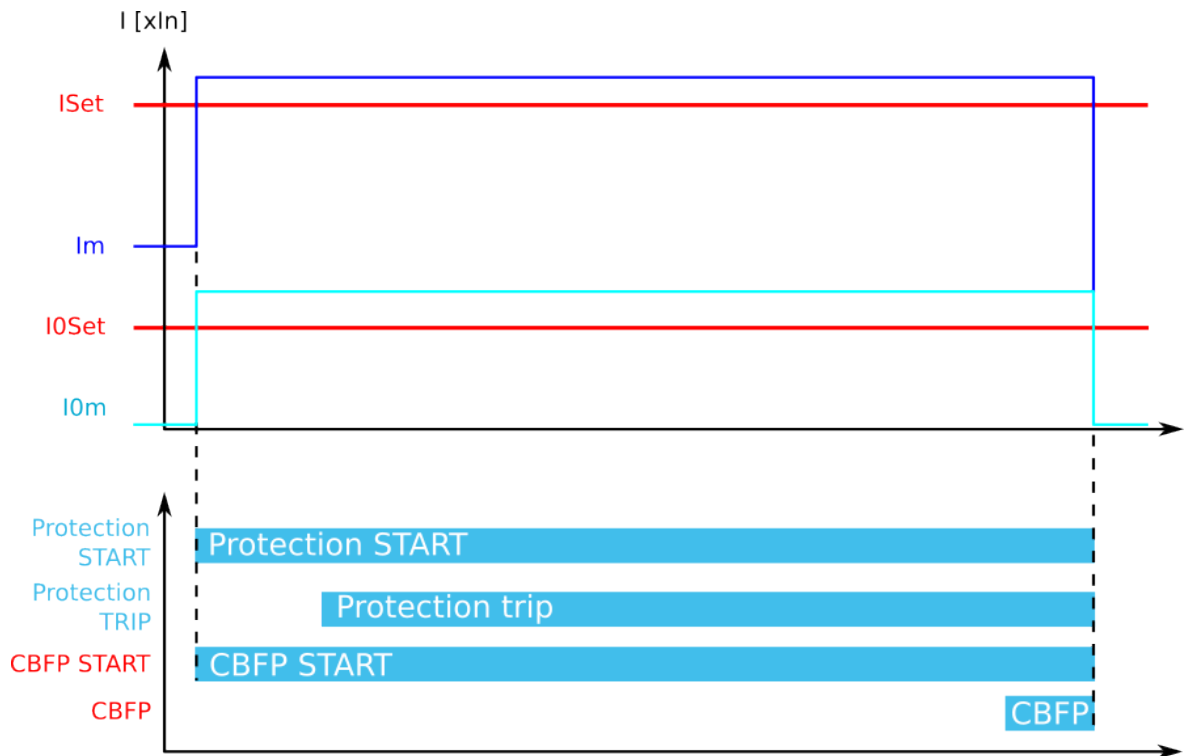

Trip and CBFP in the device configuration

Figure. 4.4.6 - 79. Wiring diagram when Trip and CBFP are configured to the device.

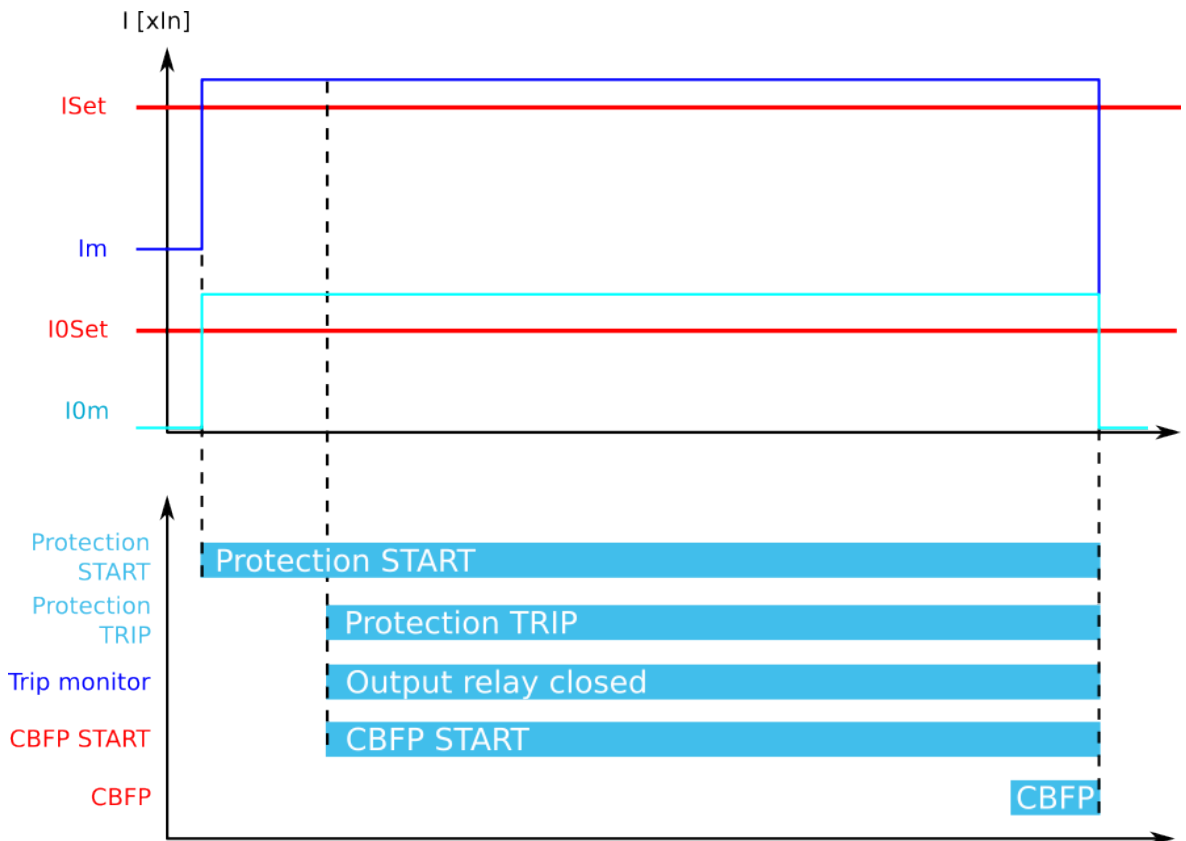

Probably the most common application is when the device's trip output controls the circuit breaker trip coil, while one dedicated CBFP contact controls the CBFP function. Below are a few operational cases regarding the various applications and settings of the CBFP function.

Figure. 4.4.6 - 80. CBFP when "Current" is the selected criterion.

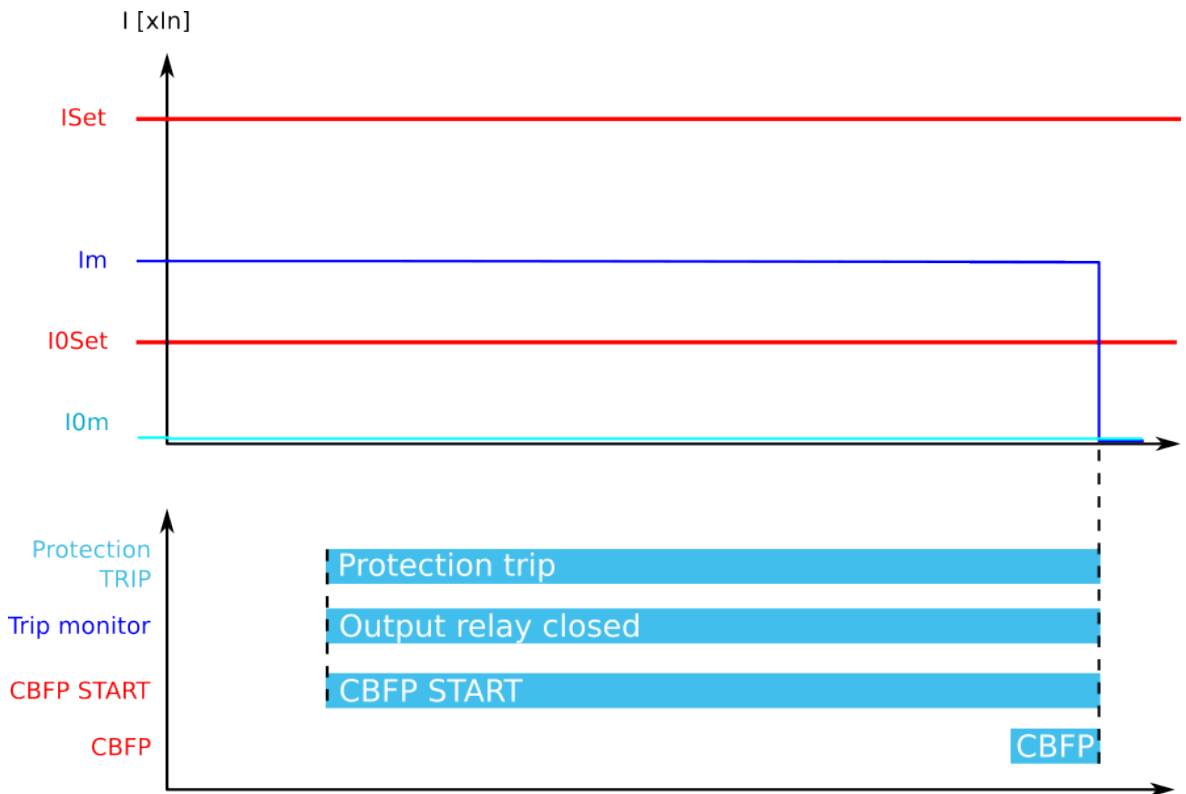

When the current threshold setting of I_{set} and/or I_{Oset} is exceeded, the current-based protection is activated and the counter for CBFP starts calculating the set operating time. The tripping of the primary protection stage is not monitored in this configuration. Therefore, if the current is not reduced below the setting limit, a CBFP signal is sent to the incoming feeder circuit breaker. If the primary protection function clears the fault, the counter for CBFP resets as soon as the measured current is below the threshold settings.

Figure. 4.4.6 - 81. CBFP when "Current and DO" is the selected criterion.

When the current threshold setting of I_{Set} and/or I_{OSet} is exceeded, the current-based protection is activated. At the same time, the counter for CBFP is halted until the monitored output contact is controlled (that is, until the primary protection operates). When the tripping signal reaches the primary protection stage, the CBFP counter starts calculating the set operating time. The tripping of the primary protection stage is constantly monitored in this configuration. If the current is not reduced below the setting limit or the primary stage tripping signal is not reset, a CBFP signal is sent to the incoming feeder circuit breaker. The time delay counter for CBFP is reset as soon as the measured current is below the threshold settings or the tripping signal is reset. This configuration allows the CBFP to be controlled by current-based functions alone, and other function trips can be excluded from the CBFP functionality.

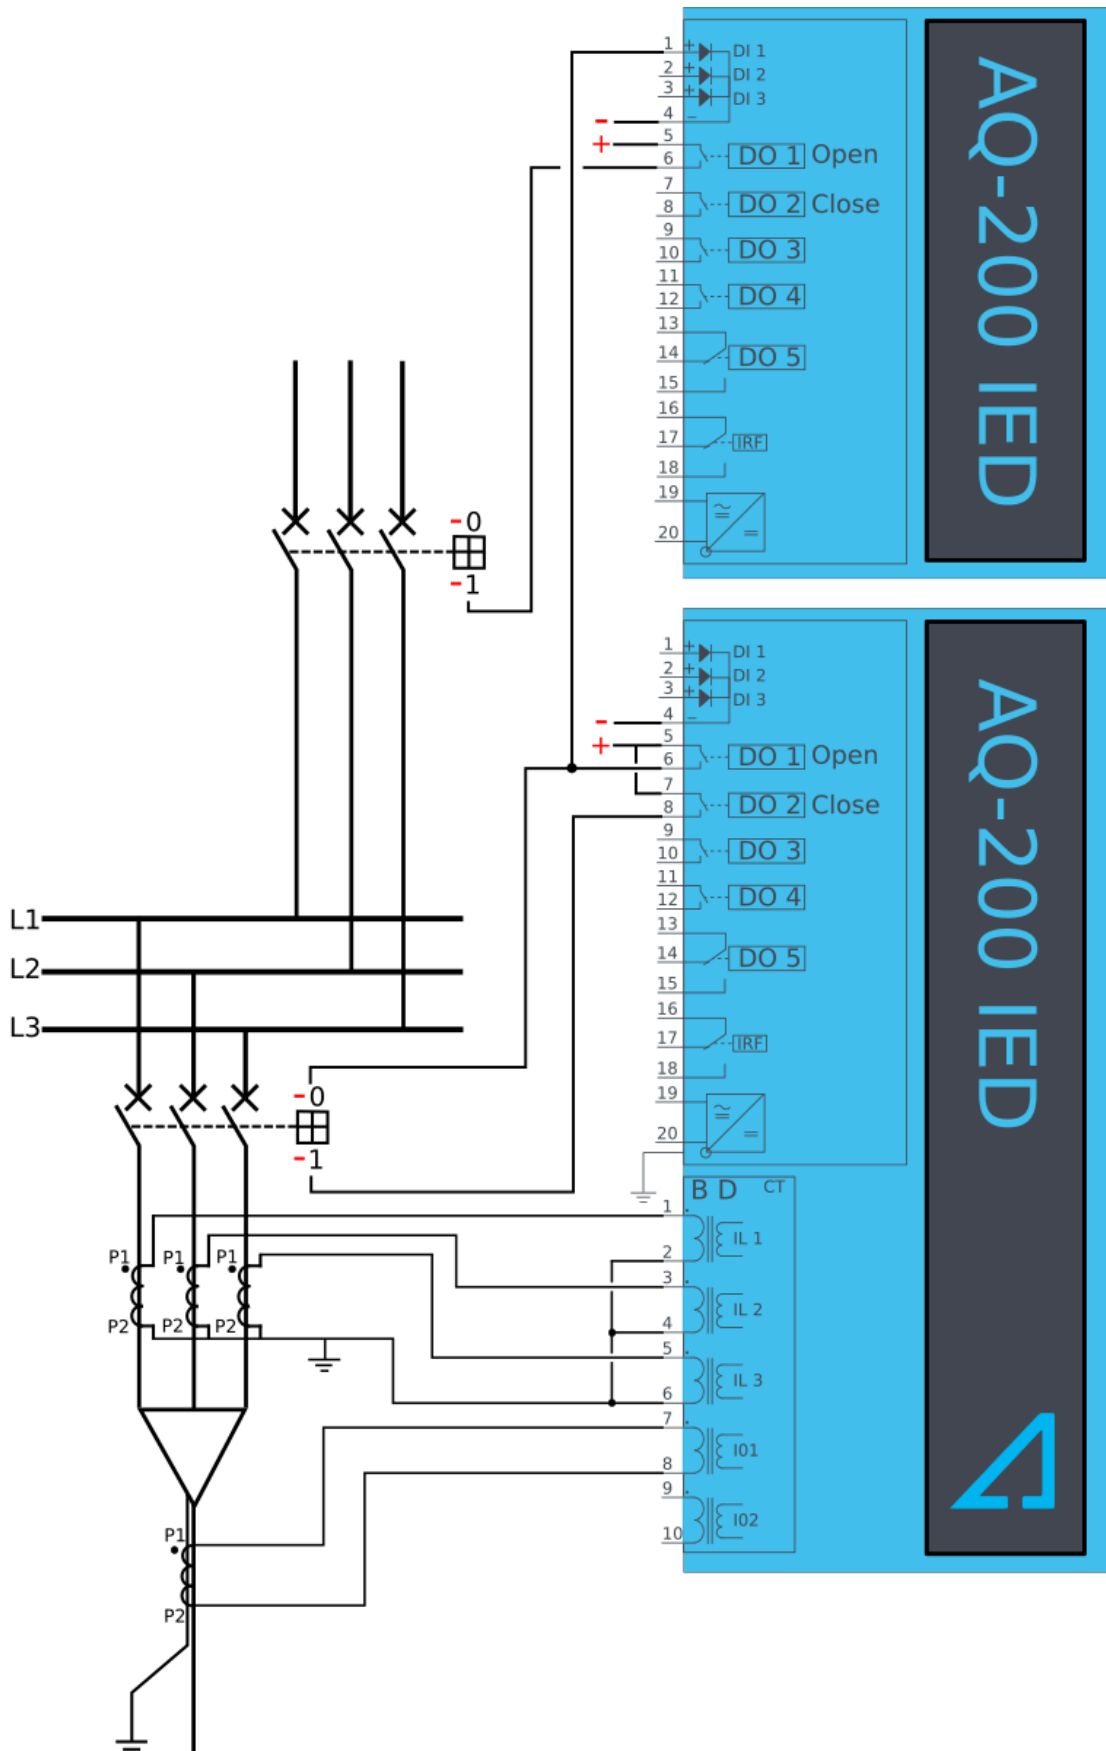

Figure. 4.4.6 - 82. CBFP when "Current or DO" is the selected criterion.

When the current threshold setting of I_{Set} and/or I_{OSet} is exceeded, or the TRIP signal reaches the primary protection stage, the function starts counting down towards the CBFP signal. The tripping of the primary protection stage is constantly monitored in this configuration regardless of the current's status. The pick-up of the CBFP is active unless the current is reduced below the setting limit and the primary stage tripping signal is reset. If either of these conditions is met (i.e. the current is above the limit or the signal is active) for the duration of the set CBFP time delay, a CBFP signal is sent to the incoming feeder circuit breaker. The time delay counter for CBFP is reset as soon as the measured current is below the threshold settings and the tripping signal is reset. This configuration allows the CBFP to be controlled by current-based functions alone, with added security from current monitoring. Other function trips can also be included to the CBFP functionality.

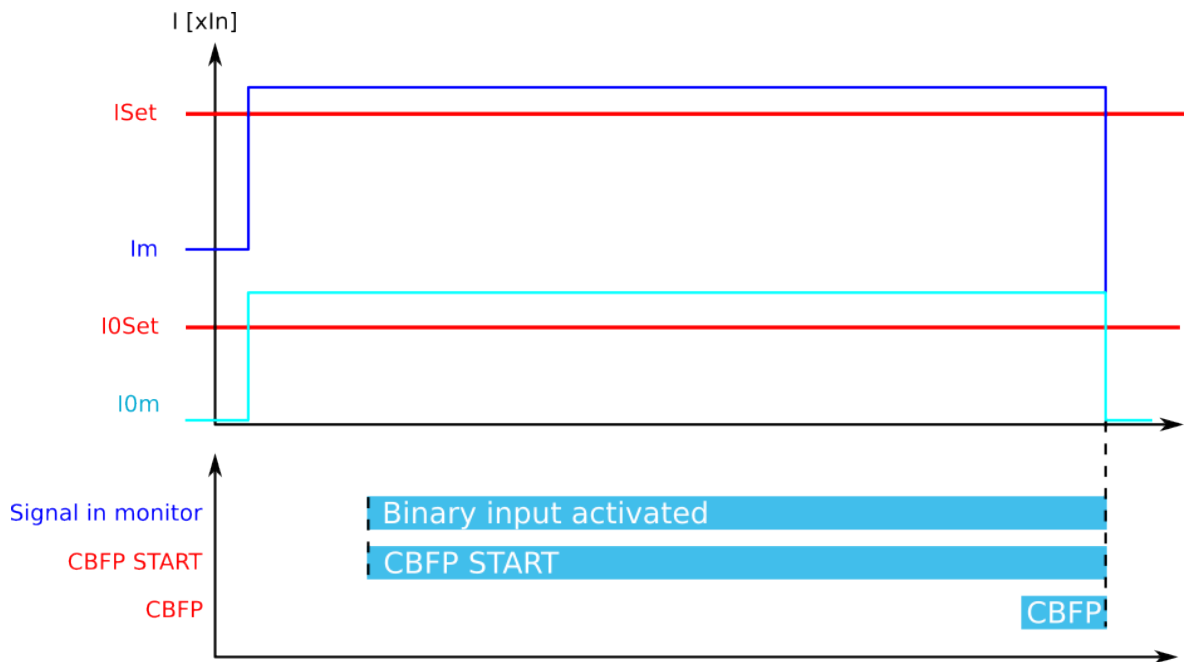

Device configuration as a dedicated CBFP unit

Figure. 4.4.6 - 83. Wiring diagram when the device is configured as a dedicated CBFP unit.

Some applications require a dedicated circuit breaker protection unit. When the CBFP function is configured to operate with a digital input signal, it can be used in these applications. When a device is used for this purpose, the tripping signal is wired to the device's digital input and the device's own TRIP signal is used only for the CBFP purpose. In this application's incoming feeder the RETRIP and CBFP signals are also available with different sets of requirements. The RETRIP signal can be used for tripping the section's feeder breaker and the CBFP signal for tripping the incoming feeder. The following example does not use retripping and the CBFP signal is used as the incoming feeder trip from the outgoing breaker trip signal. The TRIP signal can also be transported between different devices by using GOOSE messages.

Figure. 4.4.6 - 84. Dedicated CBFP operation from digital input signal.

In this mode the CBFP operates only from a digital input signal. Both current and output relay monitoring can be used. The counter for the CBFP signal begins when the digital input is activated. If the counter is active until the CBFP counter is used, the device issues a CBFP command to the incoming feeder circuit breaker. In this application the device tripping signals from all outgoing feeders can be connected to one, dedicated CBFP device which operates either on current-based protection or on all possible faults' CBFP protection.

Events and registers

The circuit breaker failure protection function (abbreviated "CBF" in event block names) generates events and registers from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

The function's outputs can be used for direct I/O controlling and user logic programming. The function also provides a resettable cumulative counters for RETRIP, CBFP, CBFP START and BLOCKED events.

Table. 4.4.6 - 66. Event messages.

Event block name	Event names
CBF1	Start ON
CBF1	Start OFF

Event block name	Event names
CBF1	Retrip ON
CBF1	Retrip OFF
CBF1	CBFP ON
CBF1	CBFP OFF
CBF1	Block ON
CBF1	Block OFF
CBF1	DO monitor ON
CBF1	DO monitor OFF
CBF1	Signal ON
CBF1	Signal OFF
CBF1	Phase current ON
CBF1	Phase current OFF
CBF1	Res current ON
CBF1	Res current OFF

The function registers its operation into the last twelve (12) time-stamped registers. The register of the function records the ON event process data for ACTIVATED, BLOCKED, etc. The table below presents the structure of the function's register content.

Table. 4.4.6 - 67. Register content.

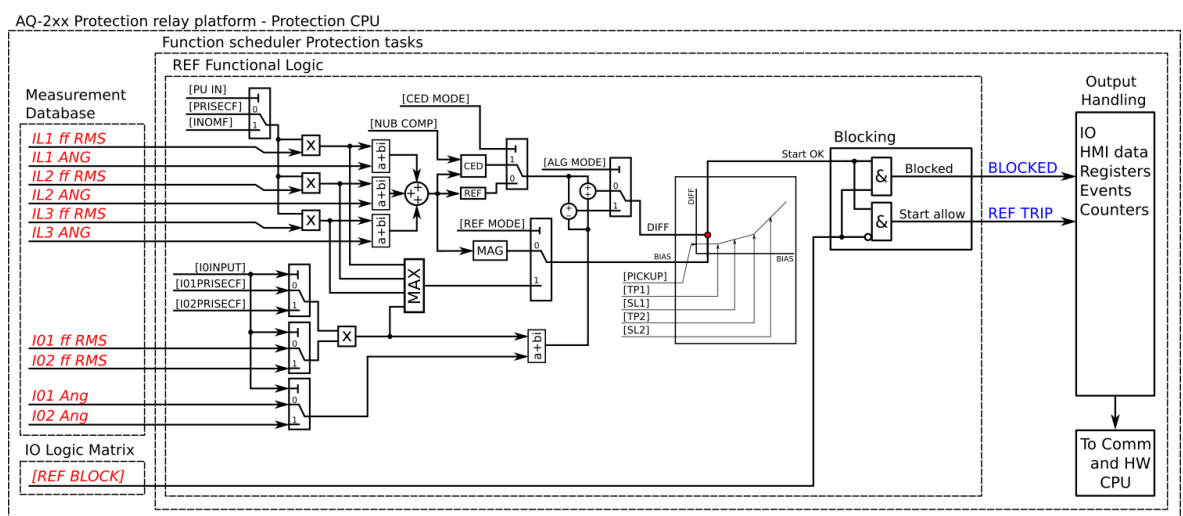

Register	Description
Date and time	dd.mm.yyyy hh:mm:ss.mss
Event	Event name
Max phase current	Highest phase current
Residual current	I01, I02 channel or calculated residual current
Time to RETR	Time remaining to retrip activation
Time to CBFP	Time remaining to CBFP activation
Setting group in use	Setting group 1...8 active

4.4.7 Low-impedance or high-impedance restricted earth fault/ cable end differential protection ($I_{0d}>$; 87N)

The low-impedance or high-impedance restricted earth fault function is used for residual differential current measurement for transformers. This function can also be used as the cable end differential function. The operating principle is low-impedance differential protection with bias characteristics the user can set. A differential current is calculated with the sum of the phase currents and the selected residual current input. In cable end differential mode the function provides natural measurement unbalance compensation for higher operating sensitivity in monitoring cable end faults.

The restricted earth fault function constantly monitors phase currents and selected residual current instant values as well as calculated bias current and differential current magnitudes.

Figure. 4.4.7 - 85. Simplified function block diagram of the $I_{0d}>$ function.

Measured input

The function block uses fundamental frequency component of phase current and residual current measurement values. Both calculated residual currents and measured residual currents are always used. The user can select either I_{01} or I_{02} for residual current measurement.

Please note that when the function is in cable end differential mode, the difference is only calculated when the measured I_0 current is available.

Table. 4.4.7 - 68. Measurement inputs of the $I_{0d}>$ function.

Signal	Description	Time base
$I_{L1}RMS$	Fundamental frequency component of phase L1 (A) current measurement	5ms
$I_{L2}RMS$	Fundamental frequency component of phase L2 (B) current measurement	5ms
$I_{L3}RMS$	Fundamental frequency component of phase L3 (C) current measurement	5ms
$I_{01}RMS$	Fundamental frequency component of residual input I_{01} measurement	5ms
$I_{02}RMS$	Fundamental frequency component of residual input I_{02} measurement	5ms
$I_{L1}Ang$	Angle of phase L1 (A) current	5ms

Signal	Description	Time base
I _{L2} Ang	Angle of phase L2 (B) current	5ms
I _{L3} Ang	Angle of phase L3 (C) current	5ms
I ₀₁ Ang	Angle of residual input I01	5ms
I ₀₂ Ang	Angle of residual input I02	5ms

General settings

The following general settings define the general behavior of the function. These settings are static i.e. it is not possible to change them by editing the setting group.

Table. 4.4.7 - 69. General settings.

Name	Range	Default	Description
I0d> force status to	<ul style="list-style-type: none"> Normal Trip Blocked 	Normal	Force the status of the function. Visible only when <i>Enable stage forcing</i> parameter is enabled in <i>General</i> menu.
I0d> in side	<ul style="list-style-type: none"> Side 1 Side 2 	Side 1	Defines which current measurement module is used by the function.
Restricted earth fault (REF) or Cable End Differential	<ul style="list-style-type: none"> REF CED 	REF	Selection of the operating characteristics. If REF is selected, the function operates with normal accuracies. If CED is selected, the natural unbalance created by the phase current CT:s can be compensated for more sensitive operation. The default setting is REF.
Compenstate natural unbalance	<ul style="list-style-type: none"> - Comp 	-	When activated while the line is energized, the currently present calculated residual current is compensated to 0. This compensation only has an effect in the CED mode.

Operating characteristics

The current-dependent pick-up and activation of the function are controlled by setting parameters, which define the current calculating method used as well as the operating characteristics.

Setting group selection controls the operating characteristics of the function, i.e. the user or user-defined logic can change function parameters while the function is running.

Table. 4.4.7 - 70. Pick-up settings.

Name	Range	Step	Default	Description
I0 Input	<ul style="list-style-type: none"> I01 I02 	-	I01	Selection of the used residual current measurement input.
I0 Direction	<ul style="list-style-type: none"> Add Subtract 	-	Add	Differential current calculation mode. This matches the directions of the calculated and measured residual currents to the application. The default setting (Add) means that $I0Calc + I01$ or $I0Calc + I02$ in a through fault yields no differential current. See figures below for connection examples.

Name	Range	Step	Default	Description
Bias current calculation	<ul style="list-style-type: none"> Residual current $(3I_0 + I_0\text{Calc})/2$ Maximum (Phase and I_0 max) 	-	Residual current	Selection of the bias current calculation. Differential characteristics biasing can use either the calculated residual current averages or the maximum of all measured currents. The residual current mode is more sensitive while the maximum current is coarser.
$I_0d>$ pick-up	0.01...50.00% (of I_n)	0.01%	10%	Setting for basic sensitivity of the differential characteristics.
Turnpoint 1	0.01...50.00 $\times I_n$	0.01 $\times I_n$	1.00 $\times I_n$	Setting for first turn point in the bias axe of the differential characteristics.
Slope 1	0.01...150.00%	0.01%	10.00%	Setting for the first slope of the differential characteristics.

$$Diff_{bias TP1...TP2} = SL1 \times (Ix - TP1) + I0_{d>pick-up}$$

$$Diff_{bias > TP2} = SL2 \times (Ix - TP2) + SL1 \times (TP2 - TP1) + I0_{d>pick-up}$$

Read-only parameters

The function's *Info* page displays useful, real-time information on the state of the protection function. It is accessed either through the device's HMI display, or through the setting tool software when it is connected to the device and its Live Edit mode is active.

Table. 4.4.7 - 71. Information displayed by the function.

Name	Range	Description
I0d> condition	<ul style="list-style-type: none"> • Normal • Trip • Blocked 	Displays the status of the protection function.

Function blocking

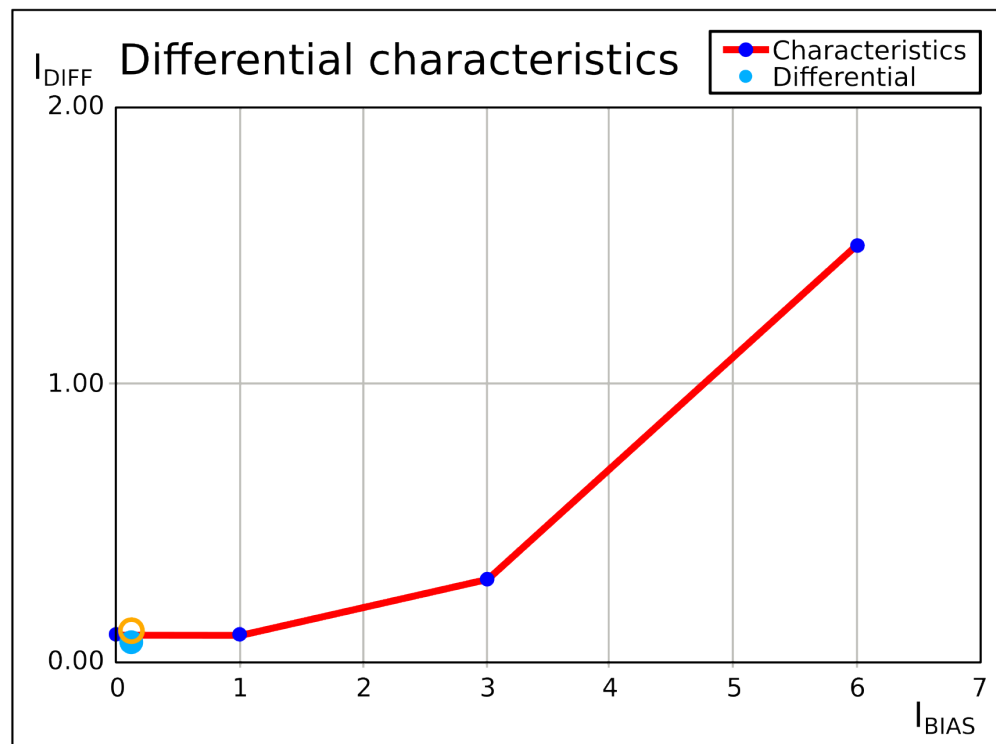

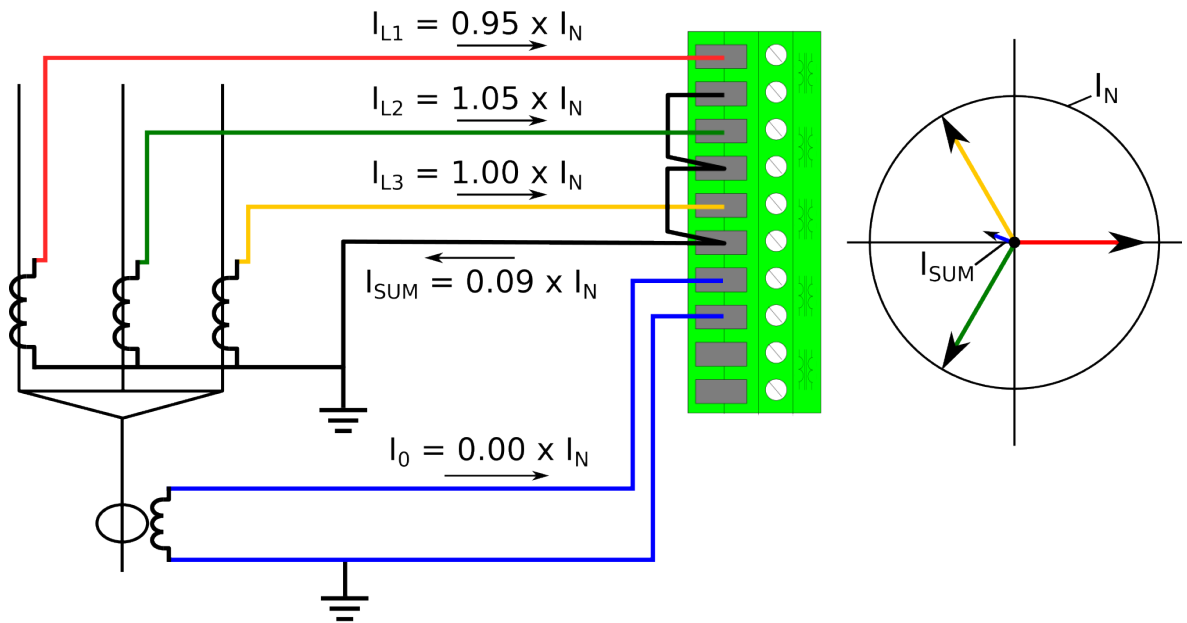

The block signal is checked in the beginning of each program cycle. The blocking signal is received from the blocking matrix in the function's dedicated input. If the blocking signal is not activated when the pick-up element activates, a TRIP signal is generated and the function proceeds to the time characteristics calculation.

If the blocking signal is active when the pick-up element activates, a BLOCKED signal is generated and the function does not process the situation further. If the TRIP function has been activated before the blocking signal, it resets and processes the release time characteristics similarly to when the pick-up signal is reset.

The variables the user can set are binary signals from the system. The blocking signal needs to reach the device minimum of 5 ms before the set operating delay has passed in order for the blocking to activate in time.

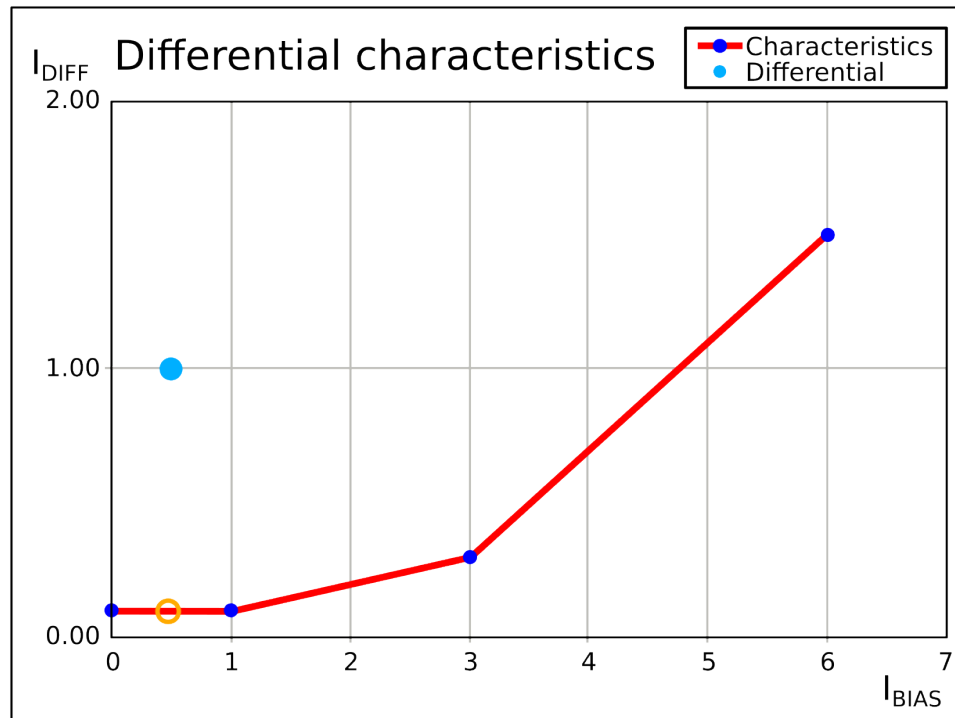

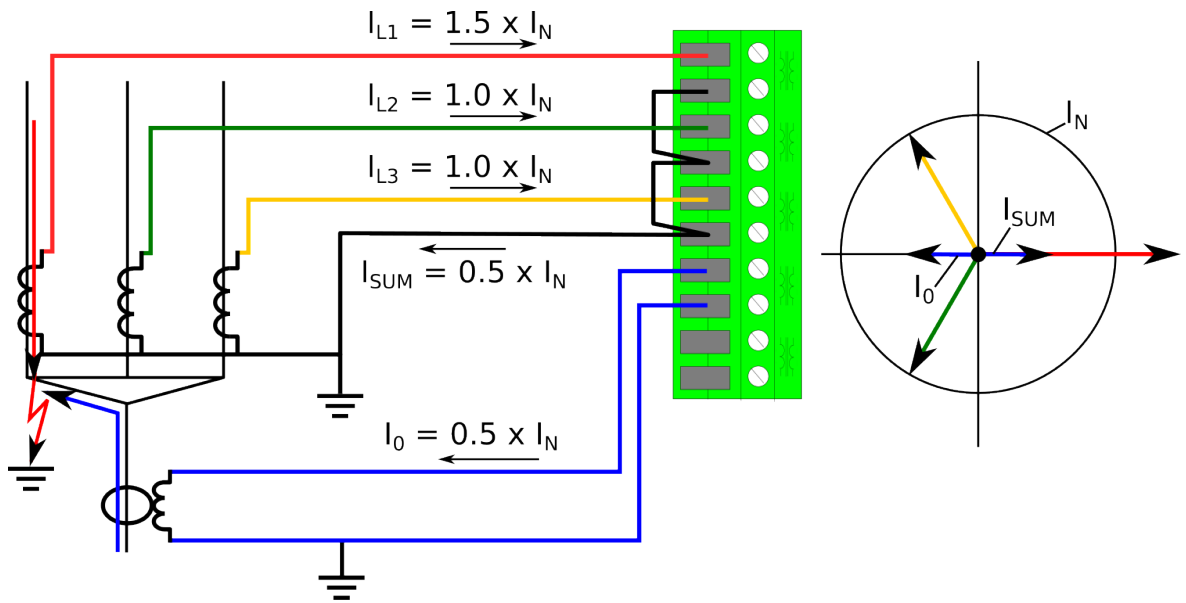

The following figures present some typical applications for this function.

Figure. 4.4.7 - 92. Cable end differential with natural unbalance in the phase current measurement.

When calculating residual current from the phase currents, the natural unbalance can be around 10 % while the used CTs are still within the promised 5P class (which is probably the most common CT accuracy class). When the current natural unbalance is compensated in this situation, the differential settings may be set to be more sensitive and the natural unbalance does not, therefore, affect the calculation.

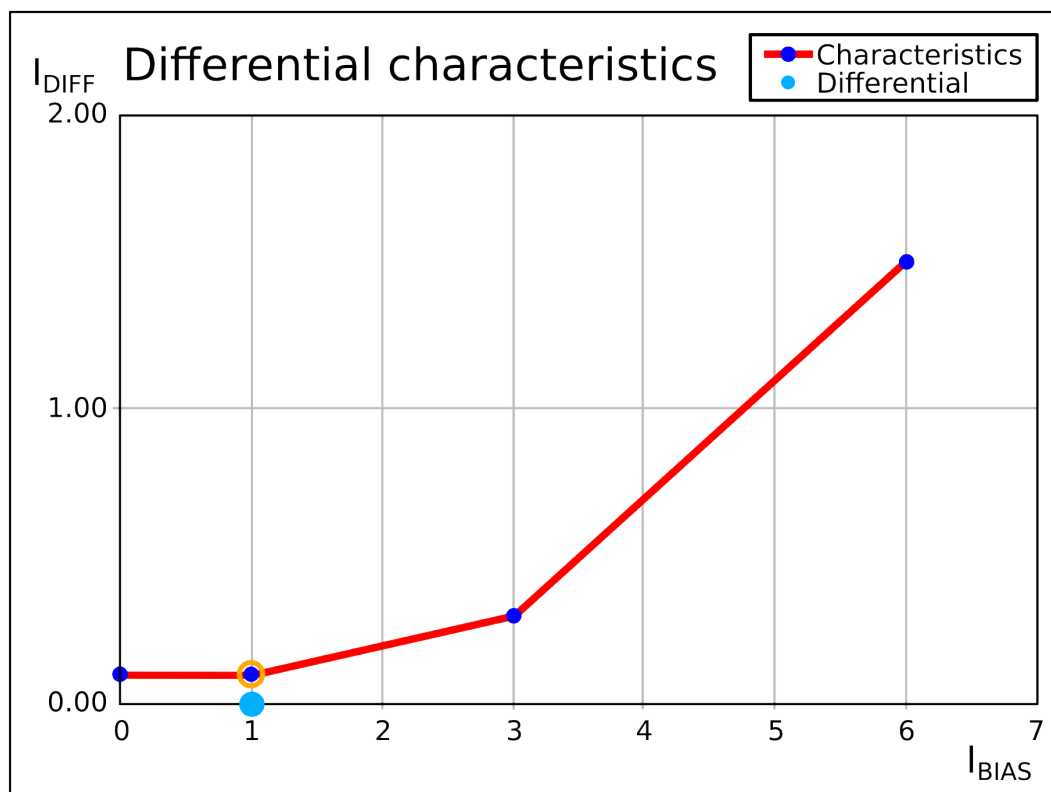

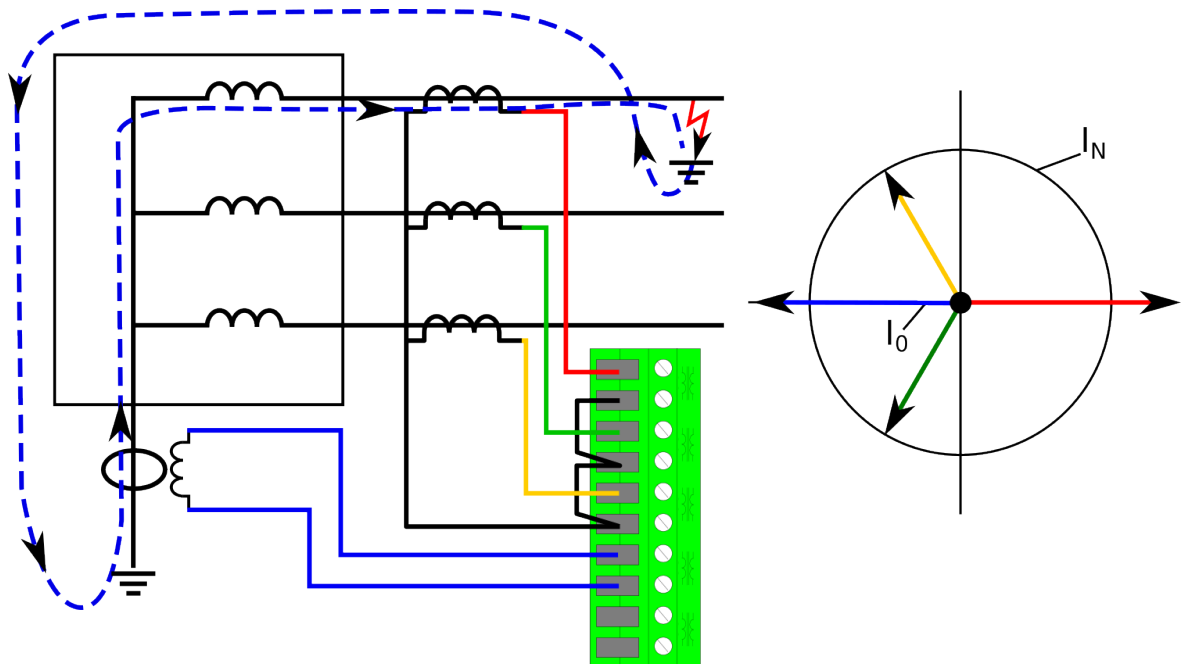

Figure. 4.4.7 - 93. Cable end differential when a fault occurs.

If a starting fault occurs in the cable end, the CED mode catches the difference between the ingoing and the outgoing residual currents. The resulting signal can be used for alarming or tripping purposes for the feeder with the failing cable end. The user can freely change both the settings and the sensitivity of the algorithm.

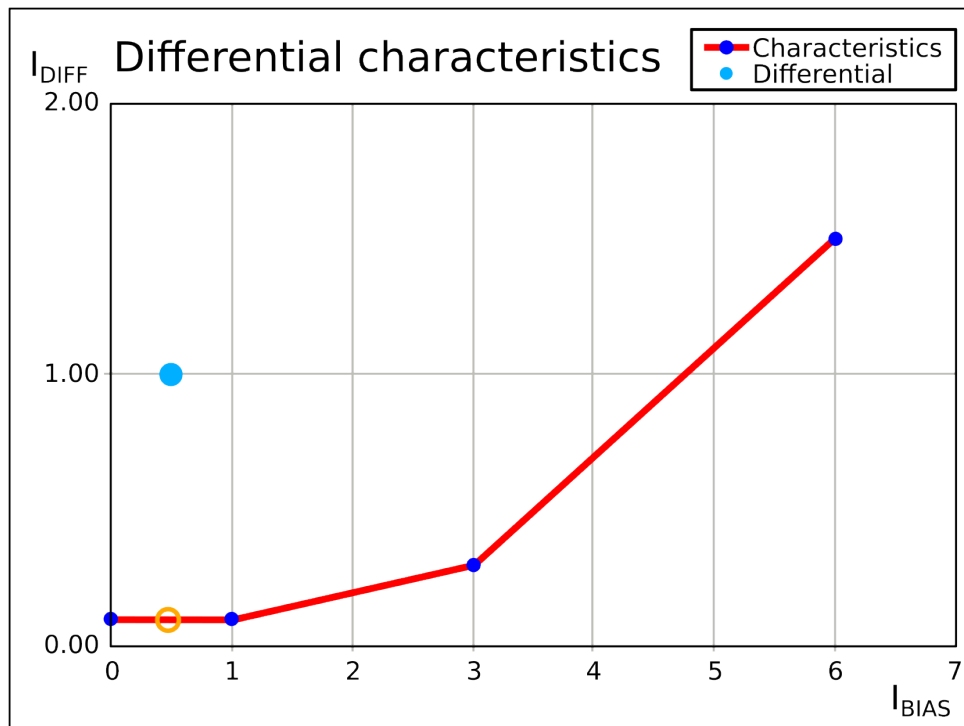

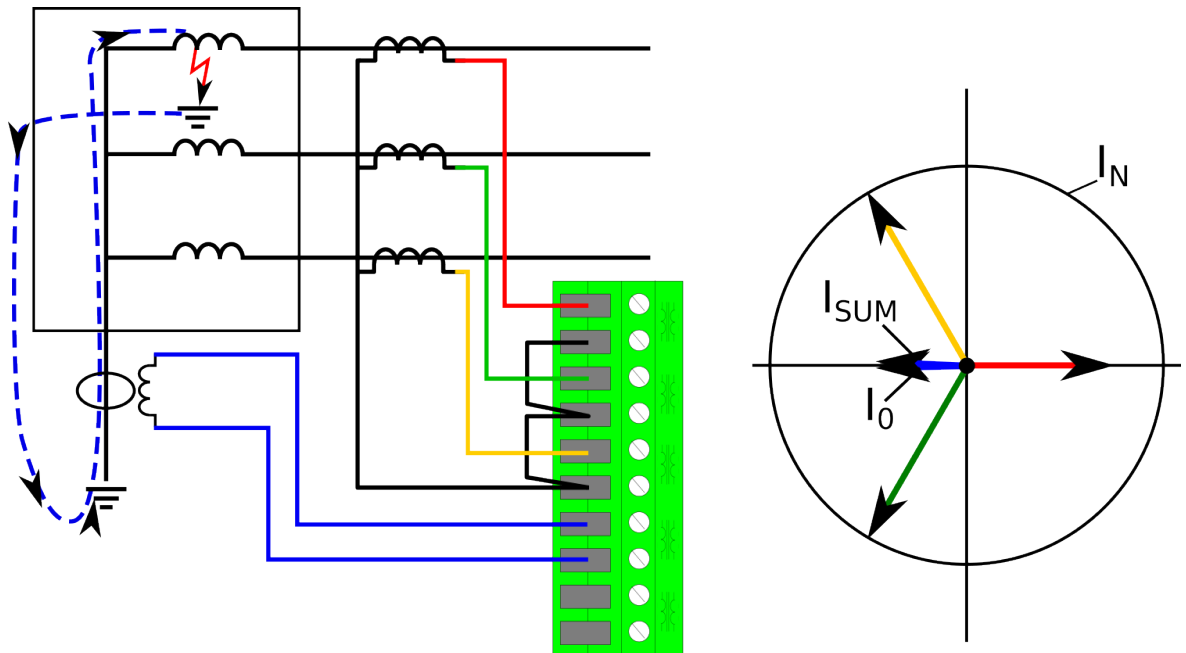

Restricted earth fault protection is usually used in the Y winding of a power transformer. This function is needed to prevent the main differential protection from being tripped by faults occurring outside the protection area; in some cases, the function has to be disabled or its sensitivity limited to catch earth faults inside the protection area. For this purpose, the restricted earth fault function is stable since it only monitors the side it is wired to, and compares the calculated and measured residual currents. During an outside earth fault the circulating residual current in the faulty phase winding does not cause a trip because the comparison of the measured starpoint current and the calculated residual current differential is close to zero.

Figure. 4.4.7 - 94. Restricted earth fault outside a Y winding transformer.

If the fault is located inside of the transformer and thus inside of the protection area, the function catches the fault with high sensitivity. Since the measured residual current now flows in the opposite direction than in the outside fault situation, the measured differential current is high.

Figure. 4.4.7 - 95. Restricted earth fault inside a Y winding transformer.

Events and registers

The restricted earth fault function (abbreviated "REF" in event block names) generates events and registers from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

The function's outputs can be used for direct I/O controlling and user logic programming. The function also provides a resettable cumulative counter for the TRIP and BLOCKED events.

Table. 4.4.7 - 72. Event messages.

Event block name	Event names
REF1	I0d> (87N) Trip ON
REF1	I0d> (87N) Trip OFF

4.4.8 Transformer status monitoring

The transformer status monitoring function is designed to be the one place where the user can set up all necessary transformer data and select the used transformer protection functions. Settings related to the protection functions can also be edited inside each function and any changes are updated into this function as well. The function calculates many transformer-related properties which are used in functions that protect and monitor the transformer. Standard transformers require only name plate data and CT scalings to get the protection device to automatically scale all measurement signals to the transformer. In special transformers manually set values can be applied to cover the transformer properties that are rarely met. Additionally, the function counts a transformer's cumulative overloading and high overcurrent time.

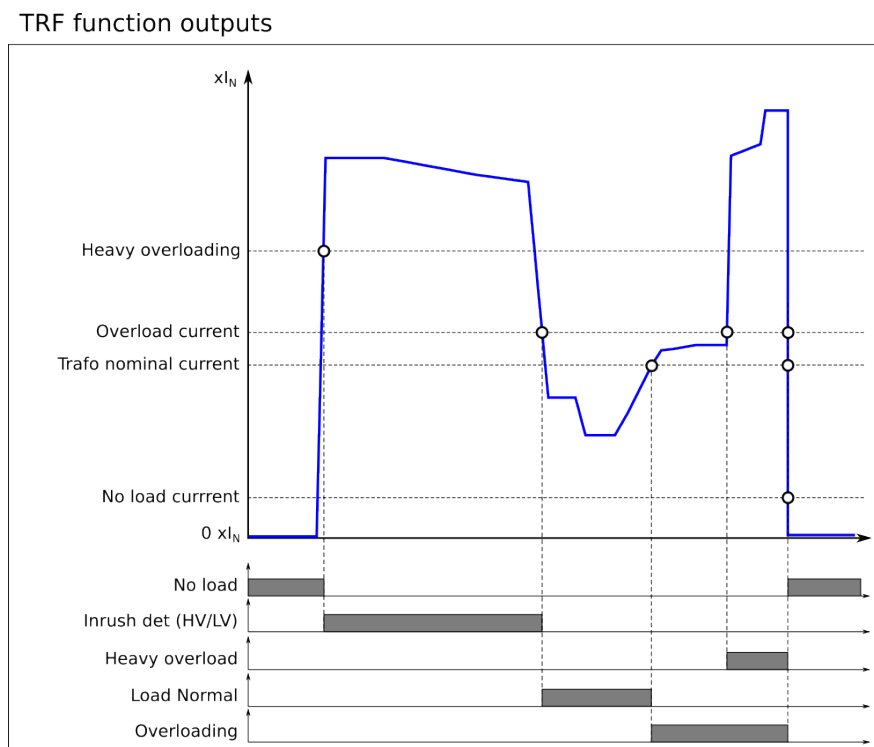

These signals can be used in indication or in logic programming, and they are the basis for the events the function generates (if so chosen).

Figure. 4.4.8 - 96. Simplified function block diagram of the transformer status monitoring function.

The function's outputs are dependent on the set transformer data because the measured currents (in p.u.) are related to the transformer nominal values. The following diagram presents the function's outputs in various situations.

Figure. 4.4.8 - 97. Activation of the function's outputs.

The **No load** signal is activated when the current dips below the "No load current" limit ($= 0.2 \times I_n$) for longer than ten milliseconds. If the current increases from this situation up to the "Heavy overloading" limit ($> 1.3 \times I_n$), the **HV inrush detection** and **LV inrush detection** signals are activated. If the measured current is between the "No load current" limit and the "Nominal current" limit, the **Load normal** signal is activated. If the measured current is between the "Nominal" and the "Heavy overloading" currents, the **Overloading** signal is activated.

These signals can be used for multiple purposes: information, transformer-related logics, and monitoring. A constant, long-lasting heavy overloading can cause oil ageing in the transformer, and thus more frequent maintenance is recommended to prevent possible problems in the transformer.

Settings and signals

The settings of the transformer status monitoring function are mostly shared with other transformer protection functions in the transformer module of the device. The following table shows these other functions that also use these settings.

Table. 4.4.8 - 74. Settings of the transformer status monitoring function and how they are shared by other protection functions.

Name	Range	Step	Default	Description
TRF force status to	<ul style="list-style-type: none"> NoForce Light/NoLoad HV inrush LV inrush Normload Overload High Overload 	-	NoForce	Force the status of the function. Visible only when <i>Enable stage forcing</i> parameter is enabled in <i>General</i> menu.
Transformer nominal	0.1...500.0MVA	0.1MVA	1.0MVA	The nominal MVA of the transformer. This value is used to calculate the nominal currents on both the HV and the LV side.
HV side nominal voltage	0.1...500.0kV	0.1kV	110.0kV	The HV side nominal voltage of the transformer. This value is used to calculate the nominal currents of the HV side.
LV side nominal voltage	0.1...500.0kV	0.1kV	110.0kV	The LV side nominal voltage of the transformer. This value is used to calculate the nominal currents of the LV side.

LV side 3ph SC to HV side	0.001...500.000kA	0.001kA	0.000kA	Shows how the calculated maximum three-phase short-circuit current in the LV side is seen in the HV side.

Name	Range	Step	Default	Description
LV side max. 2ph SC curr.	0.001...500.000kA	0.001kA	0.000kA	The calculated maximum two-phase short-circuit current in the LV poles of the transformer.
LV side 2ph SC to HV side	0.001...500.000kA	0.001kA	0.000kA	Shows how the calculated maximum two-phase short-circuit current in the LV side is seen in the HV side.

Table. 4.4.8 - 76. Output signals of the transformer status monitoring function.

Name	Description
No/Light load	The signal is active, when the function detects a current below the "No load current" limit. This signal presents a situation where there is a very light load, or only one or no side of the transformer is energized.
HV side inrush detected	The signal is active, when the detected current rises above the "High overcurrent" limit in the HV side.
LV side inrush detected	The signal is active, when the detected current rises above the "High overcurrent" limit in the LV side.
Load normal	The signal is active when the measured current is below the "Nominal current" but above the "No load current" limit.
Overloading	The signal is active, when the measured current is between the "Nominal current" and the "High overcurrent" limits.
Heavy overloading (HVY overloading)	The signal is active, when the measured current is above the "High overcurrent" limit.

Events

The transformer status monitoring function (abbreviated "TRF" in event block names) generates events from the detected transformer energizing status. The data register is available, based on the events.

Table. 4.4.8 - 77. Event messages.

Event block name	Event names
TRF1	Light/No load ON
TRF1	Light/No load OFF
TRF1	HV side inrush ON
TRF1	HV side inrush OFF
TRF1	LV side inrush ON
TRF1	LV side inrush OFF
TRF1	Load normal ON
TRF1	Load normal OFF
TRF1	Overloading ON

Event block name	Event names
TRF1	Overloading OFF
TRF1	High overload ON
TRF1	High overload OFF
TRF1	Setting changes, calculating new transformer data
TRF1	Calculation finished, possible restart

The function registers its operation into the last twelve (12) time-stamped registers. The table below presents the structure of the function's register content.

Table. 4.4.8 - 78. Register content.

Register	Description
Date and time	dd.mm.yyyy hh:mm:ss.mss
Event	Event name
HV L1 current	HV side's Phase L1 current x I _n
HV L2 current	HV side's Phase L2 current x I _n
HV L3 current	HV side's Phase L3 current x I _n
LV L1 current	LV side's Phase L1 current x I _n
LV L2 current	LV side's Phase L2 current x I _n
LV L3 current	LV side's Phase L3 current x I _n

4.4.9 Transformer thermal overload protection (TT>; 49T)

The transformer thermal overload protection function is used for monitoring and protecting thermal capacity in power transformers.

The function constantly monitors the instant values of phase TRMS currents (including harmonics up to 31st) and calculates the set thermal replica status in 5 ms cycles. The function includes a total memory function of the load current conditions according to IEC 60255-8.

The function is based on a thermal replica which represents the protected object's or cable's thermal loading in relation to the current going through the object. The thermal replica includes the calculated thermal capacity that the "memory" uses; it is an integral function which tells this function apart from a normal overcurrent function and its operating principle for overload protection applications.

The thermal image for the function is calculated according to the equation described below:

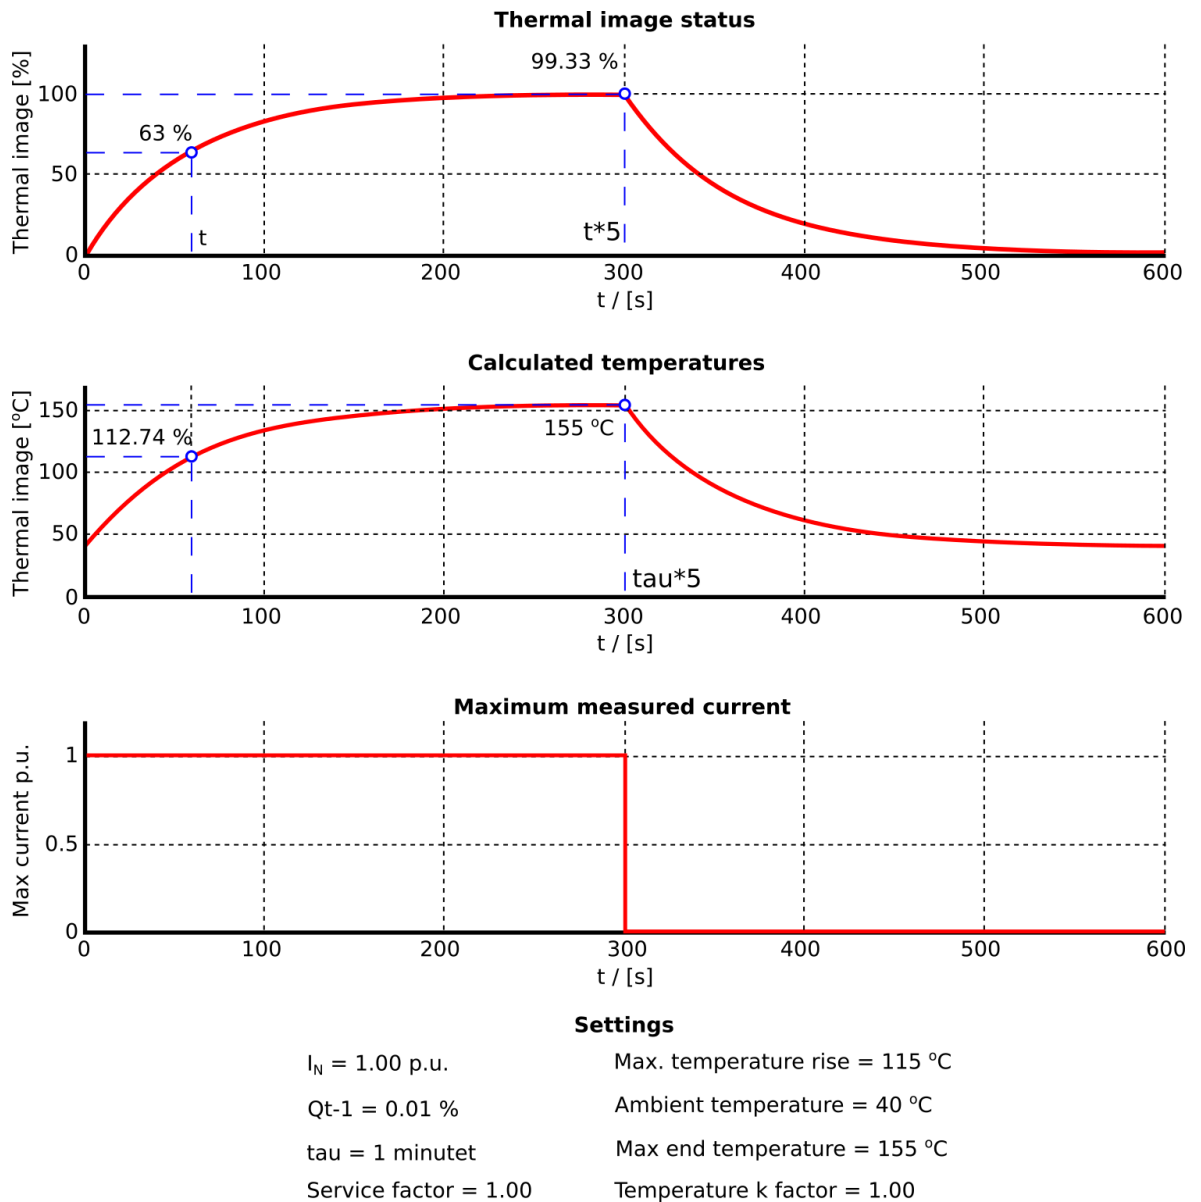

$$\theta_{t\%} = \left(\left(\theta_{t-1} - \left(\frac{I_{MAX}}{I_N \times k_{SF} \times k_{AMB}} \right)^2 \times e^{-\frac{t}{\tau_1/\tau_2}} \right) + \left(\frac{I_{MAX}}{I_N \times k_{SF} \times k_{AMB}} \right)^2 \right) \times 100\%$$

Where:

- $\theta_{t\%}$ = Thermal image status, percentage of the maximum available thermal capacity
- θ_{t-1} = Thermal image status, previous calculation cycle (the memory of the function)
- I_{\max} = Measured maximum of the three TRMS phase currents
- I_N = Current for the 100 % thermal capacity to be used (pick-up current in p.u., t_{\max} achieved in $\tau \times 5$)
- k_{SF} = Loading factor (service factor), maximum allowed load current (in p.u.) value, dependent on the protected object or cable/line installation
- k_{amb} = Temperature correction factor, either from a linear approximation or from a settable ten-point thermal capacity curve
- t = Calculation time step (0.005 s)
- e = Euler's number
- τ_1 = Thermal heating time constant of the protected object (in minutes)
- τ_2 = Thermal heating time constant of the protected object (in minutes)

The basic operating principle of the thermal replica is based on the nominal temperature rise, which is achieved when the protected object is loaded with a nominal load in a nominal ambient temperature. When the object is loaded with a nominal load for a time equal to its heating constant τ (τ), 63% of the nominal thermal capacity is used. When the loading continues until five times this given constant, the used thermal capacity approaches 100 % indefinitely but never exceeds it. With a single time constant model the cooling of the object follows this same behavior, the reverse of the heating when the current feeding is zero.

Figure. 4.4.9 - 98. Example of thermal image calculation with nominal conditions.

The described behavior is based on the assumption that the monitored object (whether a cable, a line or an electrical device) has a homogenous body which generates and dissipates heat with a rate proportional to the temperature rise caused by the current squared. This is usually the case with cables and other objects while the heat dissipation of overhead lines is dependent on the weather conditions. Weather conditions considering the prevailing conditions in the thermal replica are compensated with the ambient temperature coefficient which is constantly calculated and changing when using RTD sensor for the measurement. When the ambient temperature of the protected object is stable it can be set manually (e.g. underground cables).

The ambient temperature compensation takes into account the set minimum and maximum temperatures and the load capacity of the protected object as well as the measured or set ambient temperature. The calculated coefficient is a linear correction factor, as the following formula shows:

$$t_{Amb < t_{min}} = k_{min}$$

$$t_{Amb > t_{ref}} = \left(\frac{1 - k_{min}}{t_{ref} - t_{min}} \times (t_{AMB} - t_{min}) \right) + k_{min}$$

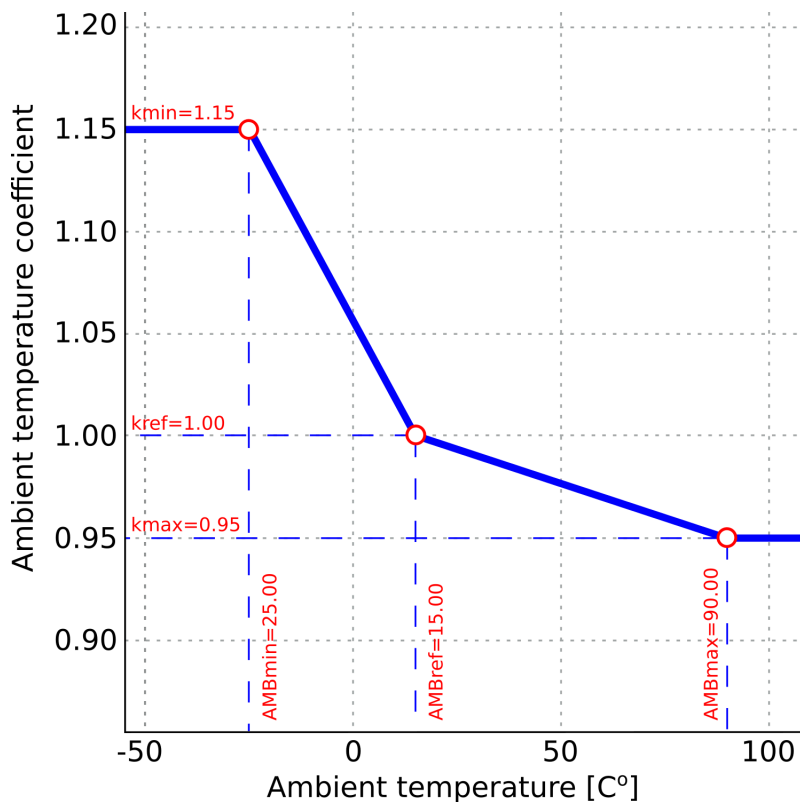

$$t_{Amb < t_{ref}} = \left(\frac{k_{max} - 1}{t_{max} - t_{ref}} \times (t_{AMB} - t_{ref}) \right) + 1.0$$

$$t_{Amb > t_{max}} = k_{max}$$

Where:

- t_{amb} = Measured (set) ambient temperature (can be set in °C or °F)
- t_{max} = Maximum temperature (can be set in °C or °F) for the protected object
- k_{max} = Ambient temperature correction factor for the maximum temperature
- t_{min} = Minimum temperature (can be set in °C or °F) for the protected object
- k_{min} = Ambient temperature correction factor for the minimum temperature
- t_{ref} = Ambient temperature reference (can be set in °C or °F, the temperature in which the manufacturer's temperature presumptions apply, the temperature correction factor is 1.0)

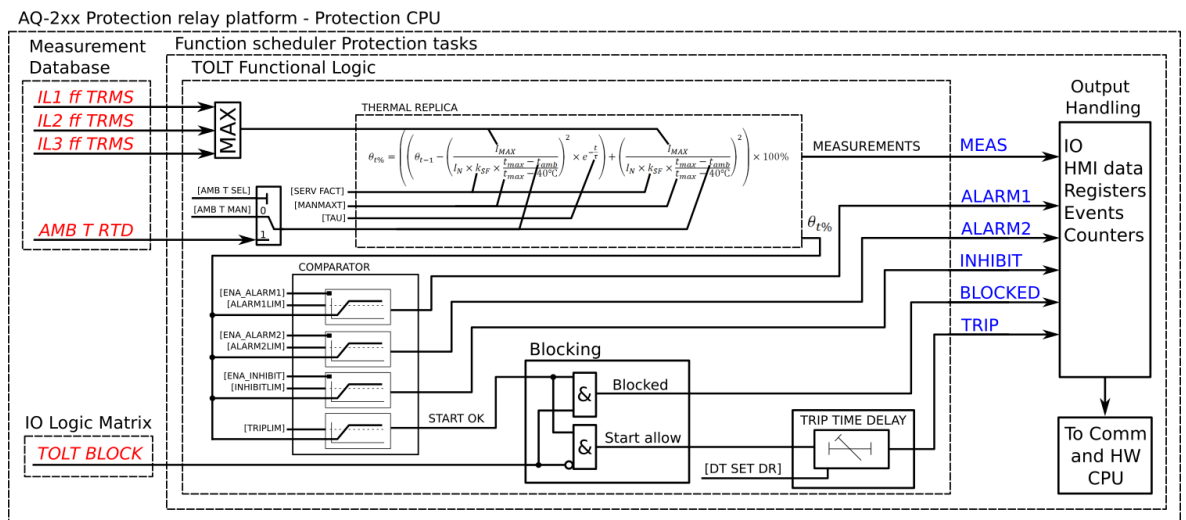

Figure. 4.4.9 - 99. Ambient temperature coefficient calculation (a three-point linear approximation and a settable correction curve).

Function inputs and outputs

The following figure presents a simplified function block diagram of the transformer thermal overload protection function.

Figure. 4.4.9 - 100. Simplified function block diagram of the TT> function.

Measured input

The function block uses phase current measurement values. The function block uses TRMS values from the whole harmonic specter of 32 components. RTD input can be used for measuring the ambient temperature.

Table. 4.4.9 - 79. Measurement inputs of the TT> function.

Signal	Description	Time base
I_{L1} TRMS	TRMS measurement of phase L1 (A) current	5 ms
I_{L2} TRMS	TRMS measurement of phase L2 (B) current	5 ms
I_{L3} TRMS	TRMS measurement of phase L3 (C) current	5 ms
RTD	Temperature measurement for the ambient correction	5 ms

Table. 4.4.9 - 80. General settings (not selectable under setting groups)

Name	Range	Default	Description
TT> mode	<ul style="list-style-type: none"> Disabled Activated 	Disabled	The selection of the function is activated or disabled in the configuration. By default it is not in use.
TT> force status to	<ul style="list-style-type: none"> Normal Blocked Alarm1 On Alarm2 On Inhibit On Trip On 	Normal	Force the status of the function. Visible only when <i>Enable stage forcing</i> parameter is enabled in <i>General</i> menu.
Temp C or F deg	<ul style="list-style-type: none"> C F 	C	The selection of whether the temperature values of the thermal image and RTD compensation are shown in Celsius or in Fahrenheit.

Table. 4.4.9 - 81. Settings for thermal replica.

Name	Range	Step	Default	Description
IN thermal cap current	0.10...40.00xI _N	0.01xI _N	1.00xI _N	The current for the 100 % thermal capacity to be used (the pick-up current in p.u., with t _{max} achieved in time τ x 5).
tau h (t const)	0.1...500.0min	0.1min	10.0min	The τ _h time constant setting. This time constant is used for the heating of the protected object.
tau c (t const)	0.1...500.0min	0.1min	10.0min	The τ _c time constant setting. This time constant is used for the cooling of the protected object.
ksF (service factor)	0.01...5.00	0.01	1.00	The service factor which corrects the value of the maximum allowed current according to installation and other conditions varying from the presumptive conditions.
Cold reset default theta	0.0...150.0%	0.1%	60.0%	The thermal image status in the restart of the function or the device. The value is given in percentages of the used thermal capacity of the protected object. It is also possible to reset the thermal element. This parameter can be used when testing the function to manually set the current thermal cap to any value.

Table. 4.4.9 - 82. Environmental settings

Name	Range	Step	Default	Description
Object max. temp. (t _{max} = 100%)	0...500deg	1deg	90deg	The maximum allowed temperature for the protected object. The default suits for Celsius range and for PEX-insulated cables.
Ambient temp. sel.	<ul style="list-style-type: none"> Manual set RTD 	-	Manual set	The selection of whether fixed or measured ambient temperature is used for the thermal image biasing.
Man. amb. temp. set	0...500deg	1deg	15deg	The manual fixed ambient temperature setting for the thermal image biasing. Underground cables usually use 15 °C. This setting is visible if "Manual set" is selected for the "Ambient temp. sel." setting.
RTD amb. temp. read.	0...500deg	1deg	15deg	The RTD ambient temperature reading for the thermal image biasing. This setting is visible if "RTD" is selected for the "Ambient temp. sel." setting.
Ambient lin. or curve	<ul style="list-style-type: none"> Linear est. Set curve 	-	Linear est.	The selection of how to correct the ambient temperature, either by internally calculated compensation based on end temperatures or by a user-settable curve. The default setting is "Linear est." which means the internally calculated correction for ambient temperature.

Name	Range	Step	Default	Description
Temp. reference (t _{ref}) k _{amb} =1.0	-60...500deg	1deg	15deg	The temperature reference setting. The manufacturer's temperature presumptions apply and the thermal correction factor is 1.00 (rated temperature). For underground cables the set value for this is usually 15 °C and for cables in the air it is usually 25 °C. This setting is visible if "Ambient lin. or curve" is set to "Linear est."
Max. ambient temp.	0...500deg	1deg	45deg	The maximum ambient temperature setting. If the measured temperature is more than the maximum set temperature, the set correction factor for the maximum temperature is used. This setting is visible if "Ambient lin. or curve" is set to "Linear est."
k at max. amb. temp.	0.01...5.00xI _N	0.01xI _N	1.00xI _N	The temperature correction factor for the maximum ambient temperature setting. This setting is visible if "Ambient lin. or curve" is set to "Linear est."
Min. ambient temp.	-60...500deg	1deg	0deg	The minimum ambient temperature setting. If the measured temperature is below the minimum set temperature, the set correction factor for minimum temperature is used. This setting is visible if "Ambient lin. or curve" is set to "Linear est."
k at min. amb. temp.	0.01...5.00xI _N	0.01xI _N	1.00xI _N	The temperature correction factor for the minimum ambient temperature setting. This setting is visible if "Ambient lin. or curve" is set to "Linear est."
Amb. temp. ref. 1...10	-50.0...500.0deg	0.1deg	15deg	The temperature reference points for the user-settable ambient temperature coefficient curve. This setting is visible if "Ambient lin. or curve" is set to "Set curve".
Amb. temp. k1...k10	0.01...5.00	1.00	0.01	The coefficient value for the temperature reference point. The coefficient and temperature reference points must be set as pairs. This setting is visible if "Ambient lin. or curve" is set to "Set curve".
Add curvepoint 3...10	<ul style="list-style-type: none"> Not used Used 	-	Not used	The selection of whether or not the curve temperature/coefficient pair is in use. The minimum number to be set for the temperature/coefficient curve is two pairs and the maximum is ten pairs. If the measured temperature is below the set minimum temperature reference or above the maximum set temperature reference, the used temperature coefficient is the first or last value in the set curve. This setting is visible if "Ambient lin. or curve" is set to "Set curve".

Pick-up settings

The operating characteristics of the machine thermal overload protection function are completely controlled by the thermal image. The thermal capacity value calculated from the thermal image can set the I/O controls with ALARM 1, ALARM 2, INHIBIT and TRIP signals.

Setting group selection controls the operating characteristics of the function, i.e. the user or user-defined logic can change function parameters while the function is running.

Table. 4.4.9 - 83. Pick-up settings.

Name	Range	Step	Default	Description
Enable TT> Alarm 1	<ul style="list-style-type: none"> Disabled Enabled 	-	Disabled	Enabling/disabling the ALARM 1 signal and the I/O.
TT> Alarm 1 level	0.0...150.0%	0.1%	40%	ALARM 1 activation threshold.
Enable TT> Alarm 2	<ul style="list-style-type: none"> Disabled Enabled 	-	Disabled	Enabling/disabling the ALARM 2 signal and the I/O.
TT> Alarm 2 level	0.0...150.0%	0.1%	40%	ALARM 2 activation threshold.
Enable TT> Rest Inhibit	<ul style="list-style-type: none"> Disabled Enabled 	-	Disabled	Enabling/disabling the INHIBIT signal and the I/O.
TT> Inhibit level	0.0...150.0%	0.1%	80%	INHIBIT activation threshold.
Enable TT> Trip	<ul style="list-style-type: none"> Disabled Enabled 	-	Disabled	Enabling/disabling the TRIP signal and the I/O.
TT> Trip level	0.0...150.0%	0.1%	100%	TRIP activation threshold.
TT> Trip delay	0.000...3600.000s	0.005s	0.000s	The trip signal's additional delay. This delay delays the trip signal generation by a set time. The default setting is 0.000 s which does not give an added time delay for the trip signal.

Function blocking

The block signal is checked in the beginning of each program cycle. The blocking signal is received from the blocking matrix in the function's dedicated input. If the blocking signal is not activated when the pick-up element activates, a START signal is generated and the function proceeds to the time characteristics calculation.

If the blocking signal is active when the pick-up element activates, a BLOCKED signal is generated and the function does not process the situation further. If the START function has been activated before the blocking signal, it resets and processes the release time characteristics similarly to when the pick-up signal is reset.

The variables the user can set are binary signals from the system. The blocking signal needs to reach the device minimum of 5 ms before the set operating delay has passed in order for the blocking to activate in time.

Measurements and indications

The function outputs measured process data from the following magnitudes:

Table. 4.4.9 - 84. General status codes.

Name	Range	Description
TT> Condition	<ul style="list-style-type: none"> Normal Alarm 1 ON Alarm 2 ON Inhibit ON Trip ON Blocked 	The function's operating condition at the moment considering binary IO signal status. No outputs are controlled when the status is "Normal".
Thermal status	<ul style="list-style-type: none"> Light/No load High overload Overloading Load normal 	The function's thermal image status. When the measured current is below 1 % of the nominal current, the status "Light/No load" is shown. When the measured current is below the trip limit, the status "Load normal" is shown. When the measured current is above the pick-up limit but below $2 \times I_n$, the status "Overloading" is shown. When the measured current is above $2 \times I_n$, the status "High overload" is shown.
TT> Setting alarm	<ul style="list-style-type: none"> SF setting ok Service factor set fault. Override to 1.0 	Indicates if SF setting has been set wrong and the actually used setting is 1.0. Visible only when there is a setting fault.

Name	Description / values
Alarm1 inits	The number of times the function has activated the Alarm 1 output
Alarm2 inits	The number of times the function has activated the Alarm 2 output
Restart inhibits	The number of times the function has activated the Restart inhibit output
Trips	The number of times the function has tripped
Trips Blocked	The number of times the function trips has been blocked

Events and registers

The line thermal overload protection function (abbreviated "TOLT" in event block names) generates events and registers from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

The function's outputs can be used for direct I/O controlling and user logic programming. The function also provides a resettable cumulative counter for the ALARM, INHIBIT, TRIP and BLOCKED events.

Table. 4.4.9 - 87. Event messages.

Event block name	Event names
TOLT1	Alarm1 ON
TOLT1	Alarm1 OFF
TOLT1	Alarm2 ON
TOLT1	Alarm2 OFF
TOLT1	Inhibit ON
TOLT1	Inhibit OFF
TOLT1	Trip ON
TOLT1	Trip OFF
TOLT1	Block ON
TOLT1	Block OFF

The function registers its operation into the last twelve (12) time-stamped registers. The register of the function records the ON event process data for TRIP, BLOCKED, etc. signals. The table below presents the structure of the function's register content.

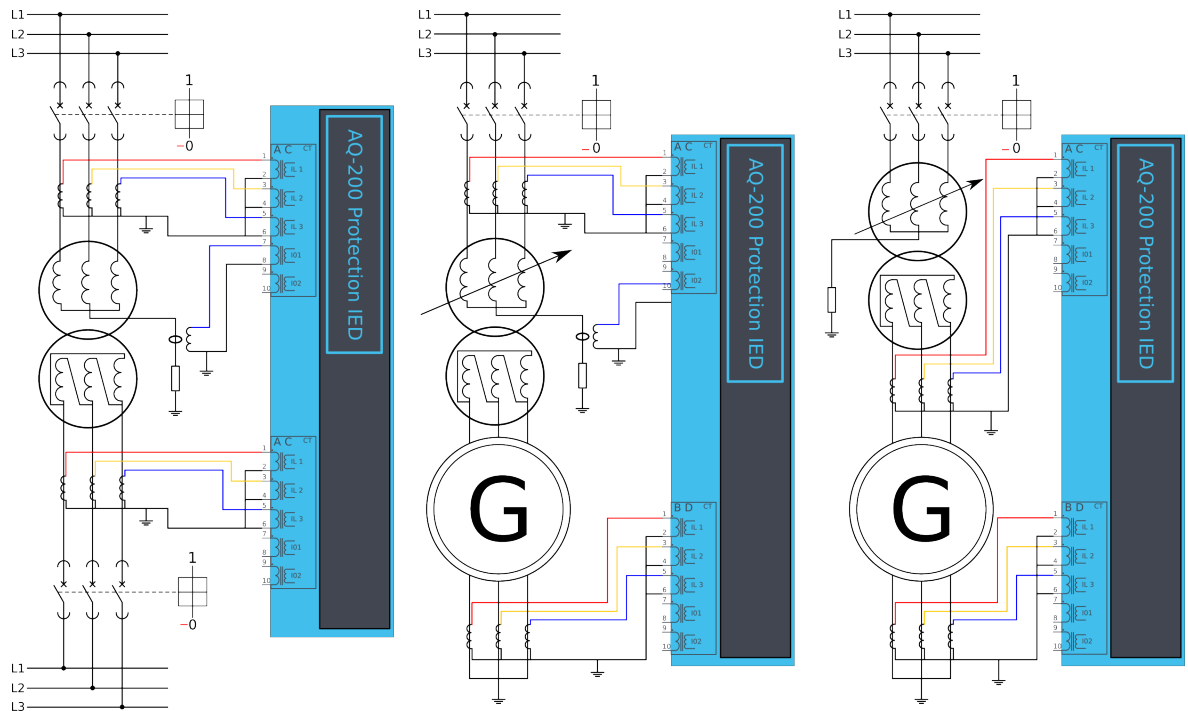

Table. 4.4.9 - 88. Register content.

Name	Description
Date and time	dd.mm.yyyy hh:mm:ss.mss
Event	Event name
Time to reach 100 % theta	seconds
Ref. T current	x I _N
Active meas. current	x I _N
T at a given moment	%
Max. temp. rise allowed	degrees
Temp. rise at a given moment	degrees
Hot spot estimate	degrees
Hot spot maximum allowed	degrees
Trip delay rem.	seconds
Setting group in use	Setting group 1...8 active

4.4.10 Generator/transformer differential protection ($I_{db} > I_{di} > I_{0dHV} > I_{0dLV}$; 87T/87N/87G)

The generator/transformer differential function is used for protecting the following power transformers: two-winding transformers, and to some extent three-winding and two-winding transformers that have double outputs and a summing application. This function can also be used for protecting generators.

Figure. 4.4.10 - 101. Differential protection function can be used for protecting transformers, generators and both at the same time.

Power transformers are seen in electric power generation, transmission, and distribution. They are also part of application networks for a wide range of purposes (eg. power and voltage levels). The most common use for a transformer is (as the name implies) to transform alternating voltage from one voltage level to another. What is common for all transformers is that they are a crucial and one of the most important single components in a network because a transformer's failure affects a wide area in the network. While transformers do not have many moving parts (apart from tap changers), their electric and mechanical properties are far from being simple.

When designing transformer protection it is usual to consider the transformer's usage as well as the power level it transforms. This is because the economical aspect becomes more significant as the size of the transformer increases, and the applied protection should be in line with the cost of the transformer. For example, there is little point in installing a high-level multifunction transformer device into a distribution transformer of a few kVA that feeds a handful of farms in a rural area network. Similarly, it is pointless to have nothing but fuses protecting a transmission transformer of a few hundred MVA that feeds entire cities.

When designing transformer protection one should consider which protection elements are needed to apply sufficient protection. The following table gives a rough idea what protection methods and elements as well as risks exist for the different types of transformers. Overlooking these points when designing transformers increase the risk of costly problems with the transformer.

Transformer	Risk level	Protection
Pole-mounted <100 kVA transformer. Distribution.	Risks are mostly environmental; the most common issue is a lightning hitting an overhead line. A broken device can be switched to a new one within hours. Relatively cheap.	Protection includes feeder overcurrent and earth fault protection. No separate protection devices are normally applied.
<500 kVA transformer in industrial use, installation indoors. Distribution, applications.	The biggest risk is overloading; cooling can be an issue if the environmental conditions are difficult. A broken device can be replaced with a new one within hours. Possible fault extension to other parts of the network or to building should be reduced. Relatively cheap.	Protection includes feeder overcurrent and earth fault protection. Fuses are used to limit the possible short-circuit current.
500kVA...2 MVA Distribution, applications, motors, small generators.	Risks include overloading, overvoltage, transients, and cooling. Replacing a broken device is costly, so fixing might be the better option if a fault occurs. It is important to monitor the device as the cost of fixing failures is probably higher than the cost of monitoring.	Protection includes overcurrent and earth fault protection, a dedicated pressure guard (Buchholz gas relay), overloading protection with winding temperature monitors. Fuses could be considered for limiting the short-circuit current. If the transformer is oil-insulated, oil level monitoring should be applied.
2MVA...100 MVA Distribution, generation, sub transmission <130 kV.	Risks include overloading, overvoltage, transients, cooling, and environmental issues. Replacing a broken device is problematic as the process is difficult and normally takes the network off-line for a long time. The device is relatively expensive. Its failure affects a wide area regardless of where it is installed (transmission, distribution, generation). Monitoring, clearing faults quickly, and limiting the device's internal fault time are all very important.	Includes the following protections: differential, overcurrent and earth fault protection, backup overcurrent and earth fault protection, tap changer protection, a dedicated pressure guard (Buchholz gas relay), overloading protection with numerical and winding temperature monitors. If the transformer is oil-insulated, oil level monitoring should be applied in addition to monitoring of loading and oil-ageing estimations. If the transformer has forced cooling, monitoring and protection for cooling systems should be applied. Multifunction relays need protections and monitoring; dedicated protection relays require backup overcurrent and earth fault protections.
>100 MVA Transmission > 130 kV	Risks include overloading, overvoltage, transients, cooling, and environmental issues. Replacing a broken device is problematic as the process is difficult and normally takes the network off-line for a long time. The device is extremely expensive. Its failure affects a wide area regardless of where it is installed (transmission, distribution, generation). Monitoring, clearing faults quickly, and limiting the device's internal fault time are all very important.	Includes the following protections: redundant differential overcurrent and earth fault protection, redundant backup overcurrent and earth fault protection, tap changer protection, a dedicated pressure guard (Buchholz gas relay), overloading protection with numerical and redundant winding temperature monitors. Oil level monitor should be applied, as well as monitoring of loading and oil-ageing estimations. If the transformer has forced cooling, monitoring and protection for cooling systems should be applied. Separated devices for control, monitoring and protection.

There are many transformer faults, e.g. dirty, watered or old transformer oil, oil leakage from the tank, as well as multiple, prolonged heavy overloading and other faults in the cooling systems. These can cause earth faults, interturn faults or even phase-to-phase faults in the windings of the transformer.

Why is differential protection needed in transformer protection?

The transformer differential function is based on calculating the difference between the ingoing and outgoing currents. If the operating status is normal, all power that comes in also goes out. If this is not the case, the transformer has an internal fault and the device should be de-energized as soon as possible to avoid extensive damage to the transformer. An operating differential function takes a faulty transformer off-line for a long time. A quick de-energizing of the fault saves money because in most cases the transformer can still be repaired which is significantly cheaper than replacing the broken device with a new one. However, there are some exceptions to this. Faults that occur within the differential protection zone but without the transformer itself (such as in the bus or in the cables connected to the transformer). Faults of this type are easily repaired and the transformer can be re-energized soon after the fault has been cleared.

If a transformer is protected only by conventional overcurrent and earth-fault protections, the operating time should be set in coordination with the low-voltage side protection relays to ensure selectivity. Therefore, transformer protection should be set to delayed operation (not instant) so that the low-voltage side protection relays can operate before transformer protection. This is necessary because under normal conditions the transformer's energizing and its short-circuit supply to the high or low voltage side is seen directly on both sides of the transformer. An overcurrent protection with instant operation causes problems with timing coordination or sensitivity, especially if the instant protection is set on high-current starting criteria. However, this is not a significant issue with smaller transformers as the installation and maintenance of various differential protections is considered more expensive than not having full protection.

Differential protection is very sensitive and it is scaled internally to the loading and fault current flowing through the transformer. For example, an interturn fault in the transformer's windings could go entirely unnoticed by an overcurrent relay while a differential relay could trip it in the very first power cycle. The same goes for internal earth faults: they can be impossible for conventional earth fault protection to notice until the fault causes heavier fault currents (such as when the fault location is close to the neutral side inside the star winding).

These are the main arguments for using differential protection: they are sensitive, their operation in internal in-zone faults is fast, and they have a high stability for out-zone faults. These guarantee a minimum of unwanted power outages as well as minimized and reduced damage to the transformer itself. On the other hand, differential protection has its negative properties: it is not very easy to set up to operate correctly, and it requires a second set of current transformers which increases installation costs. However, this cost is marginal in larger scale power transformers.

The following chapter explains the principles of transformers. It also shows how to set the differential protection correctly for the example application.

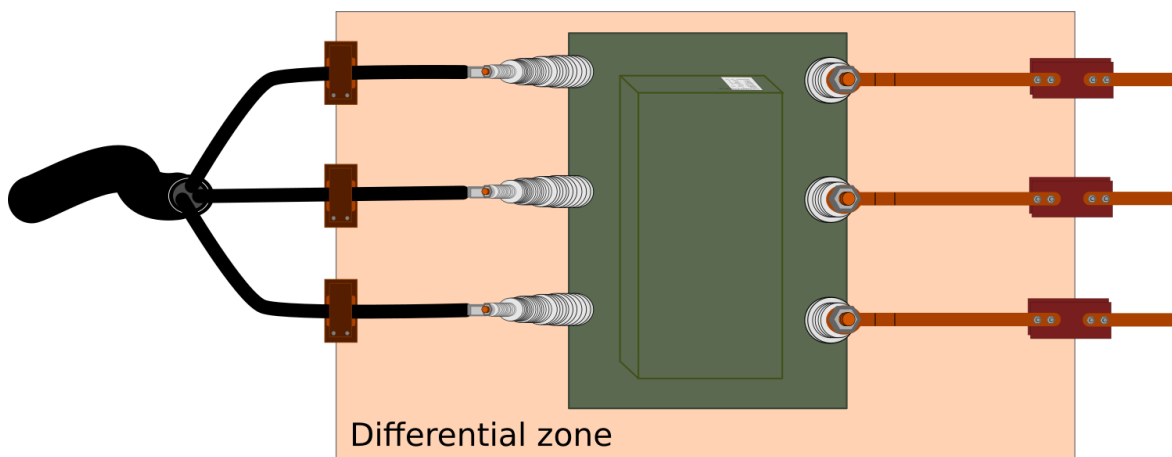

Transformer properties and basic concepts for differential protection

Setting the differential protection requires some initial data of the transformer to be known. At minimum, the following data needs to be available:

- the transformer's nominal power
- the nominal voltages of both the HV and LV sides
- the transformer's special properties, such as tap changer and auxiliary windings
- the transformer's vector group (for matching the transformer vectors in p.u.)
- the ratios and properties of the transformers HV and LV sides.

This chapter shows the setting and the principle of transformer differential protection step by step.

Figure. 4.4.10 - 102. Transformer and its components forming the differential zone.

The differential protection area is the area between the current transformers. This is called the differential zone which means that the currents going in from one side must come out from the other side. This is true whether the signal is scaled higher or lower, or whether the phase angle is shifted. Unless both side currents match there is a problem within the protected zone which either blocks or keeps the current inside the zone.

The image below shows what a typical transformer name plate looks like, what data it includes and what to do with it.

Figure. 4.4.10 - 103. Transformer name plate data.

MGT		M.G.TRAFO & Sons. Co. Ltd.	
PHASE	3		
POWER	2000	kVA	
VECTOR	Yd1		
IMP.Zk%	4.95	%	
VOLT.H.	10 000	V	
VOLT.L.	1000	V	
AMP.H.	116	A	
AMP.L.	1155	A	
FREQUENCY	50	Hz	

According to the data on this example name plate, this transformer is designed for three-phase usage and therefore it has two windings. The nominal power of the transformer is 2 MVA. Its vector group is Yd1: this means that the high-voltage side is connected to the Y and the low-voltage side to the delta, resulting in the LV side having a 30-degree lag in relation to the HV side. Additionally, the HV side's nominal voltage is 10 kV and its amperage is 116 A, on the LV side the nominal voltage is 1kV and its amperage is 1.155 kA. The transformer's short-circuit impedance is 4.95 %; it is based on the transformer's final test and presents how much short-circuit current the transformer is able to feed. The transformer's frequency is 50 Hz. This kind of information is usually available in a transformer's name plate and documentation. If the transformer has a tap changer, its information is usually also available in the name plate data.

Nominal current matching is the first thing to consider in differential protection. Usually a modern numerical protection relay can calculate these factors itself as long as the transformer's nominal power and voltage levels are known. However, if one feels inclined to calculate the amplitude matching factor, they can do so with the formulas presented below.

For this example, let us say we want to do these calculation for the transformer whose name plate we have in the image above. Let us further say the HV side current transformers are 150/5 A and the LV side current transformers are 1200/5 A. The primary side factor (p.u.) and current are then calculated as follows:

$$I_{n,HV} = \frac{S_n}{\sqrt{3} \times U_{HV}} = \frac{2\,000\,000\text{ VA}}{\sqrt{3} \times 10\,000\text{ V}} = 115.47\text{ A}$$

$$I_{pu,pri,HV} = \frac{I_{n,HV}}{CT_{pri,HV}} = \frac{115.47\text{ A}}{150\text{ A}} = 0.77$$

$$I_{pu,sec,HV} = I_{pu,pri,HV} \times CT_{sec,HV} = 0.77 \times 5\text{ A} = 3.85\text{ A}$$

Then, the secondary side factor (p.u.) and current are calculated as follows:

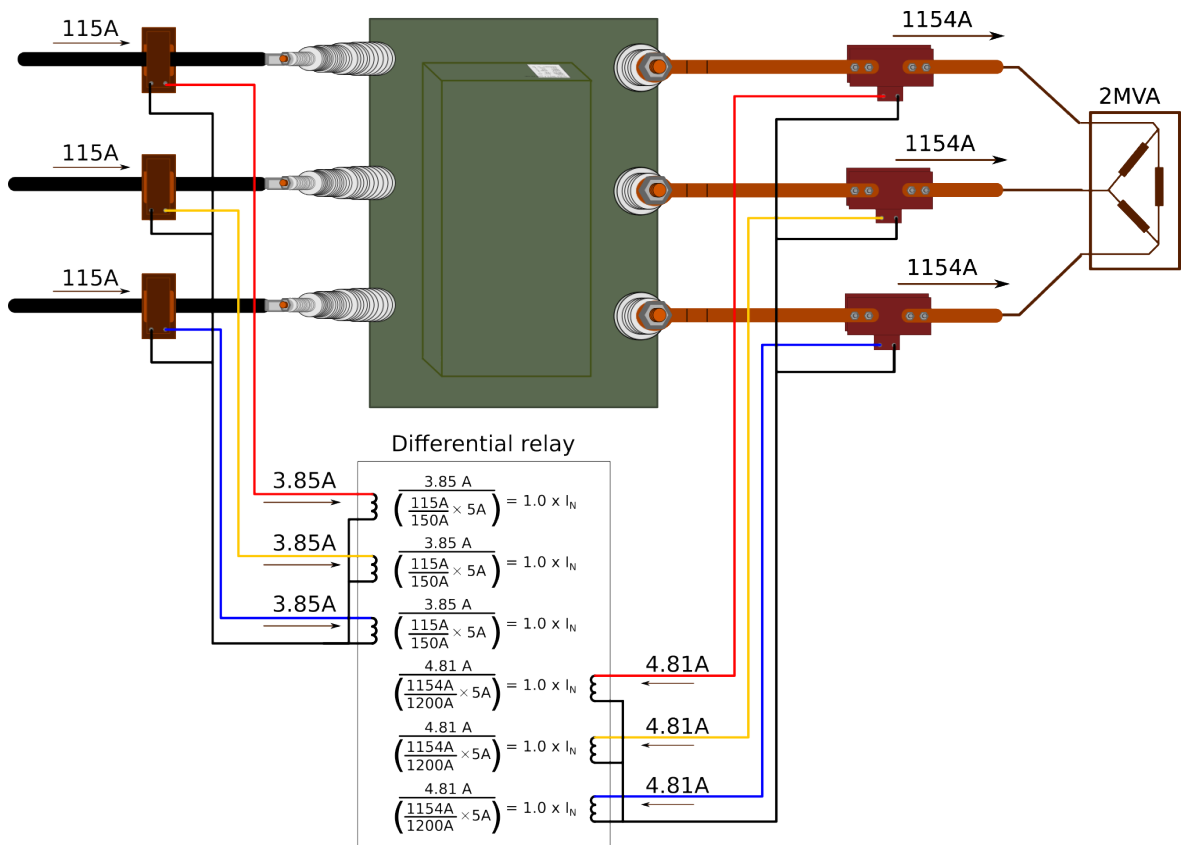

$$I_{n,LV} = \frac{S_n}{\sqrt{3} \times U_{LV}} = \frac{2\,000\,000\text{ VA}}{\sqrt{3} \times 1\,000\text{ V}} = 1154.7\text{ A}$$

$$I_{pu,pri,LV} = \frac{I_{n,LV}}{CT_{pri,LV}} = \frac{1154.7\text{ A}}{1200\text{ A}} = 0.96$$

$$I_{pu,sec,LV} = I_{pu,pri,LV} \times CT_{sec,LV} = 0.96 \times 5\text{ A} = 4.81\text{ A}$$

The calculations show that if 2 MVA of power go through the transformer the CT's secondary current on the high-voltage side will be 3.85 A and the CT secondary current on the low-voltage side will be 4.81 A. The differential function uses these values to change them into measured currents in per unit. Therefore, it would show $1.0 \cdot I_n$ for both HV and LV side measurements, even though the measured currents are different. This is called amplitude matching of the HV and LV sides. In modern differential relays this is done automatically when the nominal values and CT ratings are set for the transformer. Thus, these calculations only have nice-to-know informational value.

Figure. 4.4.10 - 104. Amplitude scaling to match the nominal currents and CTs in the differential relay.

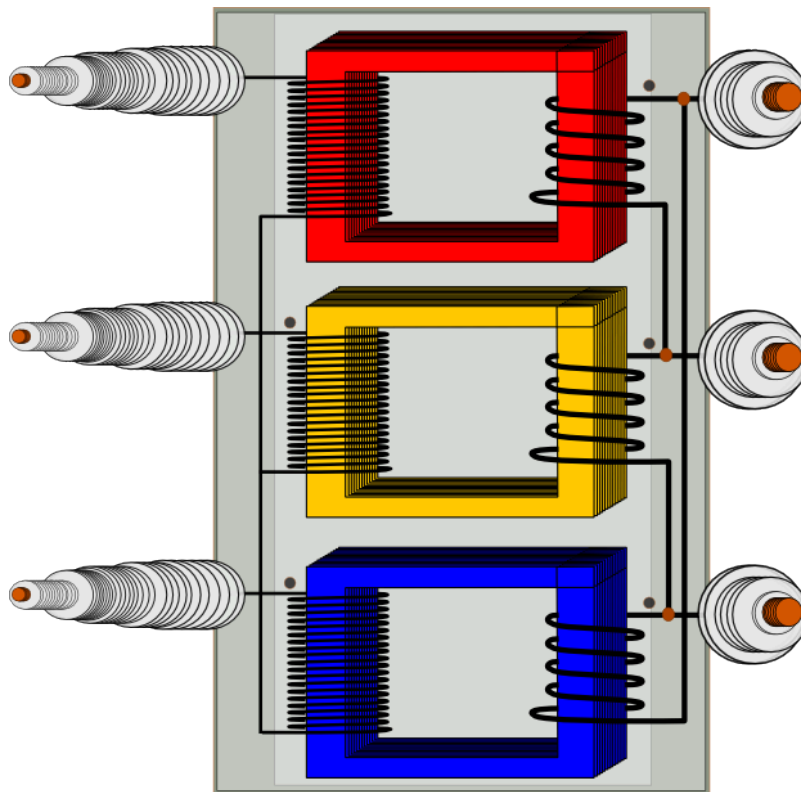

Nominal current matching is only part of the differential protection settings. The vector group of the transformer is also important, since the differential function is interested in the angle difference of the measured current vectors. In this example the transformer's vector group is Yd1, which means that the transformer's HV side is connected to the Y and the LV side to the delta. Therefore, the LV side is in 30-degree lag in relation to the HV side vectors.

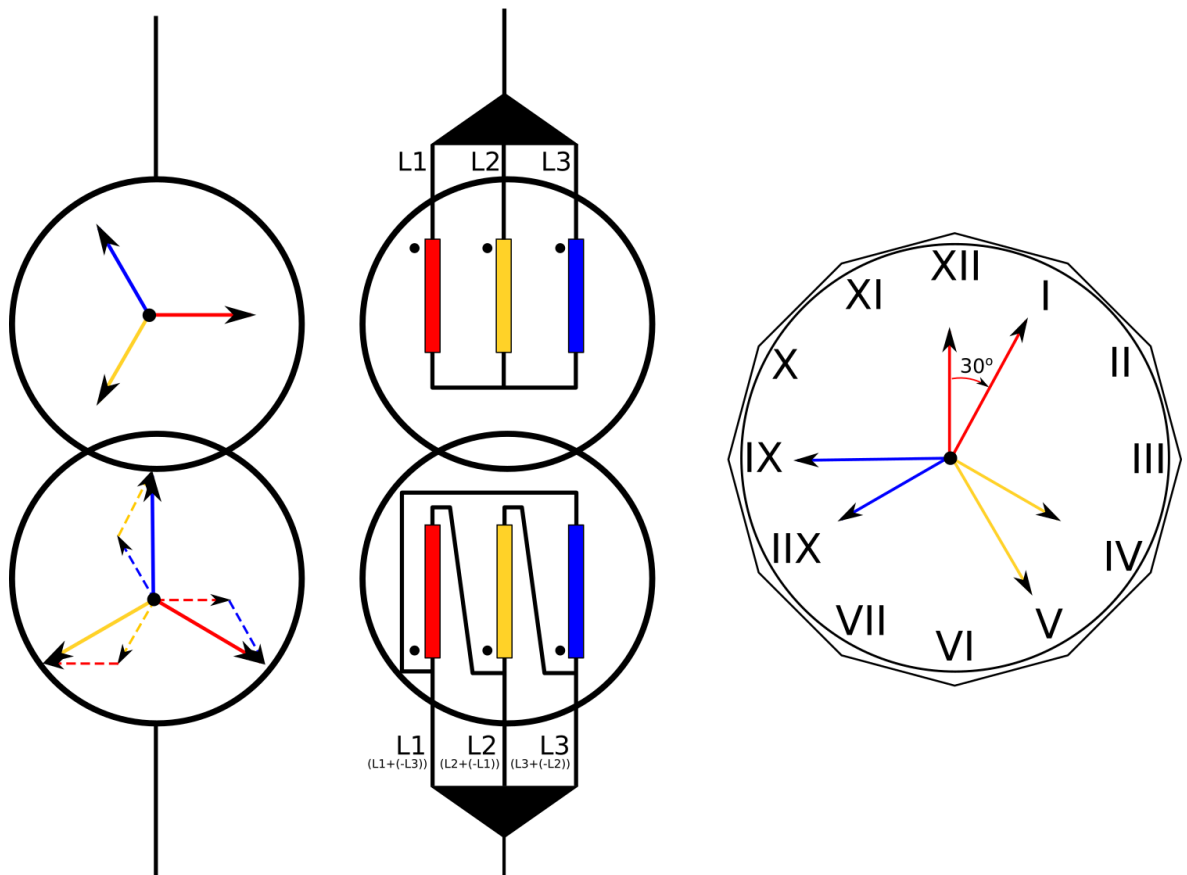

The number '1' in the vector group's name comes from the angle in the phase current difference between the HV and the LV side. If one imagines the HV side current's Y placed upside down on the face of a clock (with the Y's leg pointing at 12), the LV side's delta would be pointing at 1. Likewise, '11' means that the LV side is leading 30 degrees; '5' and '7' are just the other ends of the windings thus causing a 180-degree difference between the '1' and '11' clock numbers.

The following example explains transformer current vectors and what a connection might look like.

Figure. 4.4.10 - 105. Yd1 transformer's internal connection (in theory).

Yd1

In modern protection relays these standard vector groups (Y or delta, lead or lag) are defined by a setting selection and there is no need for interposing transformers. Even if the transformer's vector group is not standard it should still be settable within the protection relay (such as with zigzag transformers).

In this example, the function translates the delta side currents. The correction applies not only to the angles but also to the amplitudes because the delta side (in p.u.) is relative to the amplitude difference with the Y-connected side.

$$\overline{IL1DS}_{LV} = \frac{(\overline{IL1}_{LV} - \overline{IL2}_{LV})}{\sqrt{3}}$$

$$\overline{IL2DS}_{LV} = \frac{(\overline{IL2}_{LV} - \overline{IL3}_{LV})}{\sqrt{3}}$$

$$\overline{IL3DS}_{LV} = \frac{(\overline{IL3}_{LV} - \overline{IL1}_{LV})}{\sqrt{3}}$$

This process is called vector group matching for the currents (in p.u.) of the transformer. This matching is necessary whenever one side is connected to the delta and another to the Y. Previously in non-numerical relays, this matching was done by interposing CTs which connected the power transformer's Y side to the delta, and the transformer's delta side to the Y. This got the HV and LV side vectors to match each other. Then the currents in the protection relay inputs are summed up. If there is no difference (as the HV and LV side currents negate each other), the pick-up is not triggered. If the currents do have a difference, the current flows to the protection relay input and with enough difference causes a pick-up and a trip. However, as modern differential relays do this transformation by calculating the corrected vector internally, this is also just nice-to-know information not related to the actual operation of the relay.

Figure. 4.4.10 - 106. Expected phase shifts from HV side to LV side (a symmetrical situation).

	Phase angles HV side				Phase angles LV side		
	Shift(deg)	IL1	IL2	IL3	IL1"	IL2"	IL3"
Yy0, Yyn0, YNy0, Dd0	0	0	240	120	0	240	120
Yy6, Yyn6, YNy6, YNyn6, Dd6	180	0	240	120	180	60	300
Yd1, YNd1, Dy1, Dyn1	-30	0	240	120	330	210	90
Yd11, YNd11, Dy11, Dyn11	30	0	240	120	30	270	150
Yd5, YNd5, Dy5, Dyn5	-150	0	240	120	210	90	330
Yd7, YNd7, Dy7, Dyn7	150	0	240	120	150	30	270

The direction of the CTs' Y legs on the HV and LV sides affects how the differential calculation method is set. The setting options are "add" and "subtract" which is why the CTs' current direction has to be taken into account. The "add" mode is used when the CT's starpoints are either pointing towards each other or away from each other. The "subtract" mode is used when those points are pointing in the same direction. In this example the correct setting would be the "add" mode because the CTs in the main circuit are connected to the opposite and thus the measured currents from the CTs are also opposite. The user selects how they want the signals shown: the CTs' currents can be negated with the "subtract" option, resulting in a one Y-connected vector diagram.

The images below present the differential algorithm itself (one calculating formula for each phase difference); first the "subtract" formulas, then the "add" formulas. Selection is based on the CT connections.

Figure. 4.4.10 - 107. "Subtract" formula.

$$L1DIFF_{Subt} = |\overline{IL1_{HV}} - \overline{IL1_{LV}}|$$

$$L2DIFF_{Subt} = |\overline{IL2_{HV}} - \overline{IL2_{LV}}|$$

$$L3DIFF_{Subt} = |\overline{IL3_{HV}} - \overline{IL3_{LV}}|$$

Figure. 4.4.10 - 108. "Add" formula.

$$L1DIFF_{Add} = |\overline{IL1_{HV}} + \overline{IL1_{LV}}|$$

$$L2DIFF_{Add} = |\overline{IL2_{HV}} + \overline{IL2_{LV}}|$$

$$L3DIFF_{Add} = |\overline{IL3_{HV}} + \overline{IL3_{LV}}|$$

Figure. 4.4.10 - 109. CTs' starpoints requiring the "Add" mode.

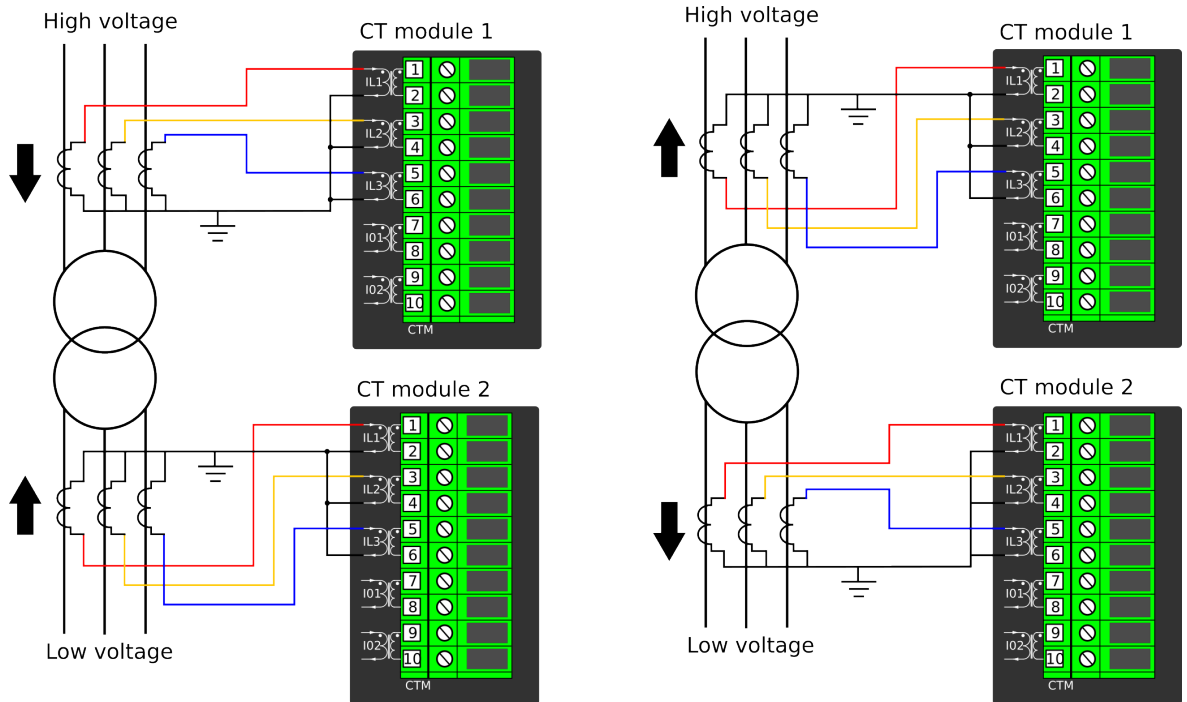

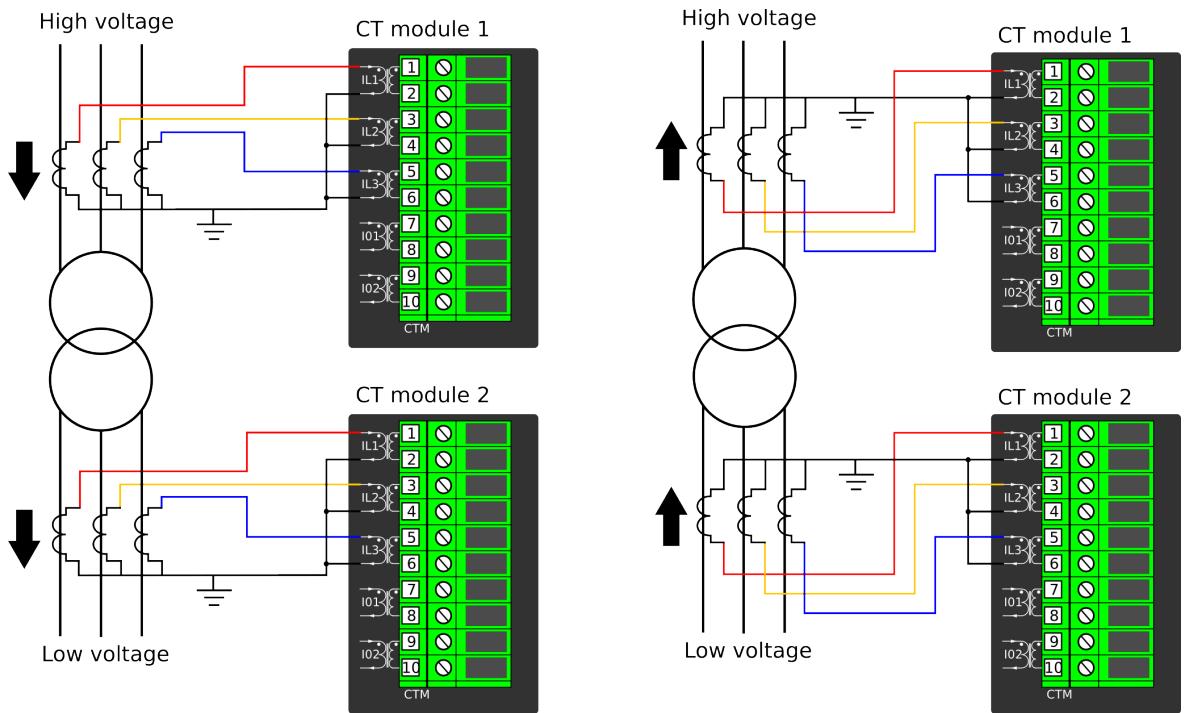

Figure. 4.4.10 - 110. CTs' starpoints requiring the "Subtract" mode.

The differential function has two (2) separate stages built into the function. Non-restraint characteristics use only the "Average mode and Max mode formulas (described below) as the comparison base. Restraint characteristics also make a so-called bias calculation for each of the phases in order to adjust the differential stage towards the measured currents. Bias calculation can be sensitive or coarse (see the following formulas).

Figure. 4.4.10 - 111. Average mode (sensitive biasing).

$$L1BIAS_{AVG} = \frac{|IL1_{HV}| + |IL1_{LV}|}{2}$$

$$L2BIAS_{AVG} = \frac{|IL2_{HV}| + |IL2_{LV}|}{2}$$

$$L3BIAS_{AVG} = \frac{|IL3_{HV}| + |IL3_{LV}|}{2}$$

Figure. 4.4.10 - 112. Max mode (coarse biasing).

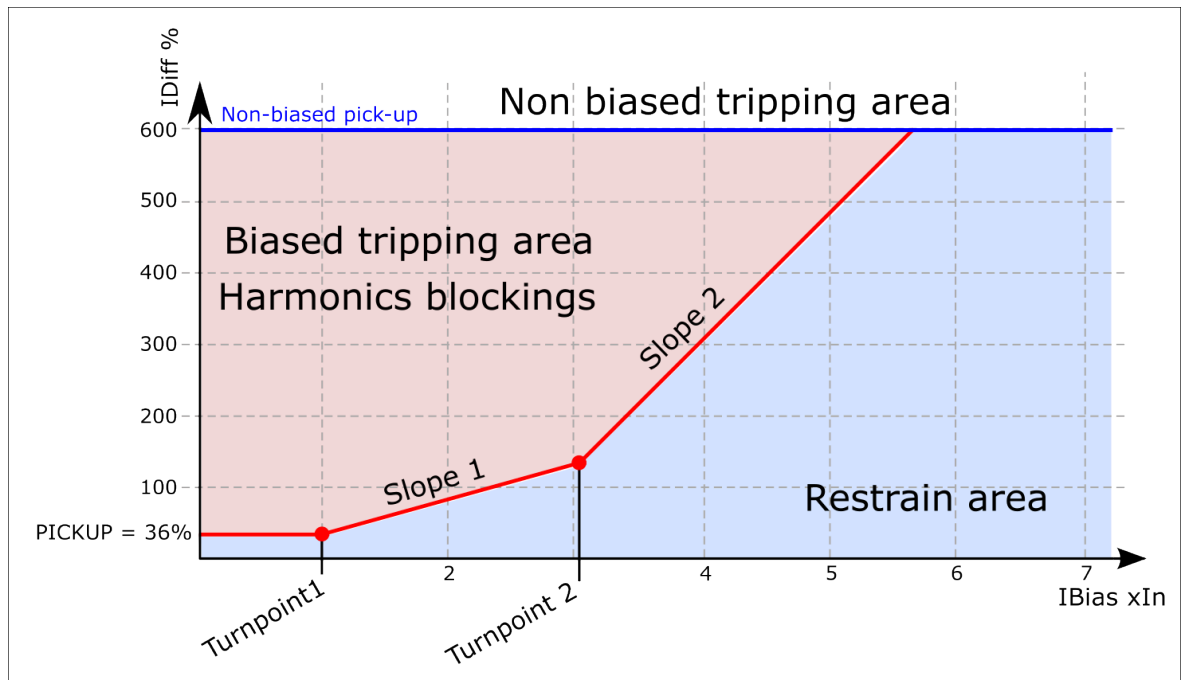

$$L1BIAS_{MAX} = \max(|IL1_{HV}|, |IL1_{LV}|)$$

$$L2BIAS_{MAX} = \max(|IL2_{HV}|, |IL2_{LV}|)$$

$$L3BIAS_{MAX} = \max(|IL3_{HV}|, |IL3_{LV}|)$$

Next, these two formulas are combined in a graph: the x-axis presents the measured differential current, and the y-axis presents the calculated bias current. The following graph shows the differential function characteristic, both biased and non-biased.

Figure. 4.4.10 - 113. Differential function characteristic, biased and non-biased.

The graph is the function of measured biasing current and the differential protection current. The red line presents the allowed differential current in percentages. In this example the non-biased pick-up is set lower than in a normal transformer application. The settings and the ranges of the differential protection function are presented in the "Settings and signals" section of this topic.

The biasing characteristic is formed with the following formulas:

$$Diff_{bias < TP1} = I_{d>pick-up}$$

$$Diff_{bias TP1...TP2} = SL1 \times (Ix - TP1) + I_{d>pick-up}$$

$$Diff_{bias > TP2} = SL2 \times (Ix - TP2) + SL1 \times (TP2 - TP1) + I_{d>pick-up}$$

These form a straight line from zero current to Turnpoint (TP1). From TP1 to TP2 is the first slope (Slope 1) which causes the set biasing to be coarser when the measured current amplitude increases. When the measured current is higher than the TP2 set value, the second slope (Slope 2) is used.

Differential characteristics settings

Characteristics parts

One needs to understand what the various parts of the characteristics mean in order to set the characteristics for the transformer application.

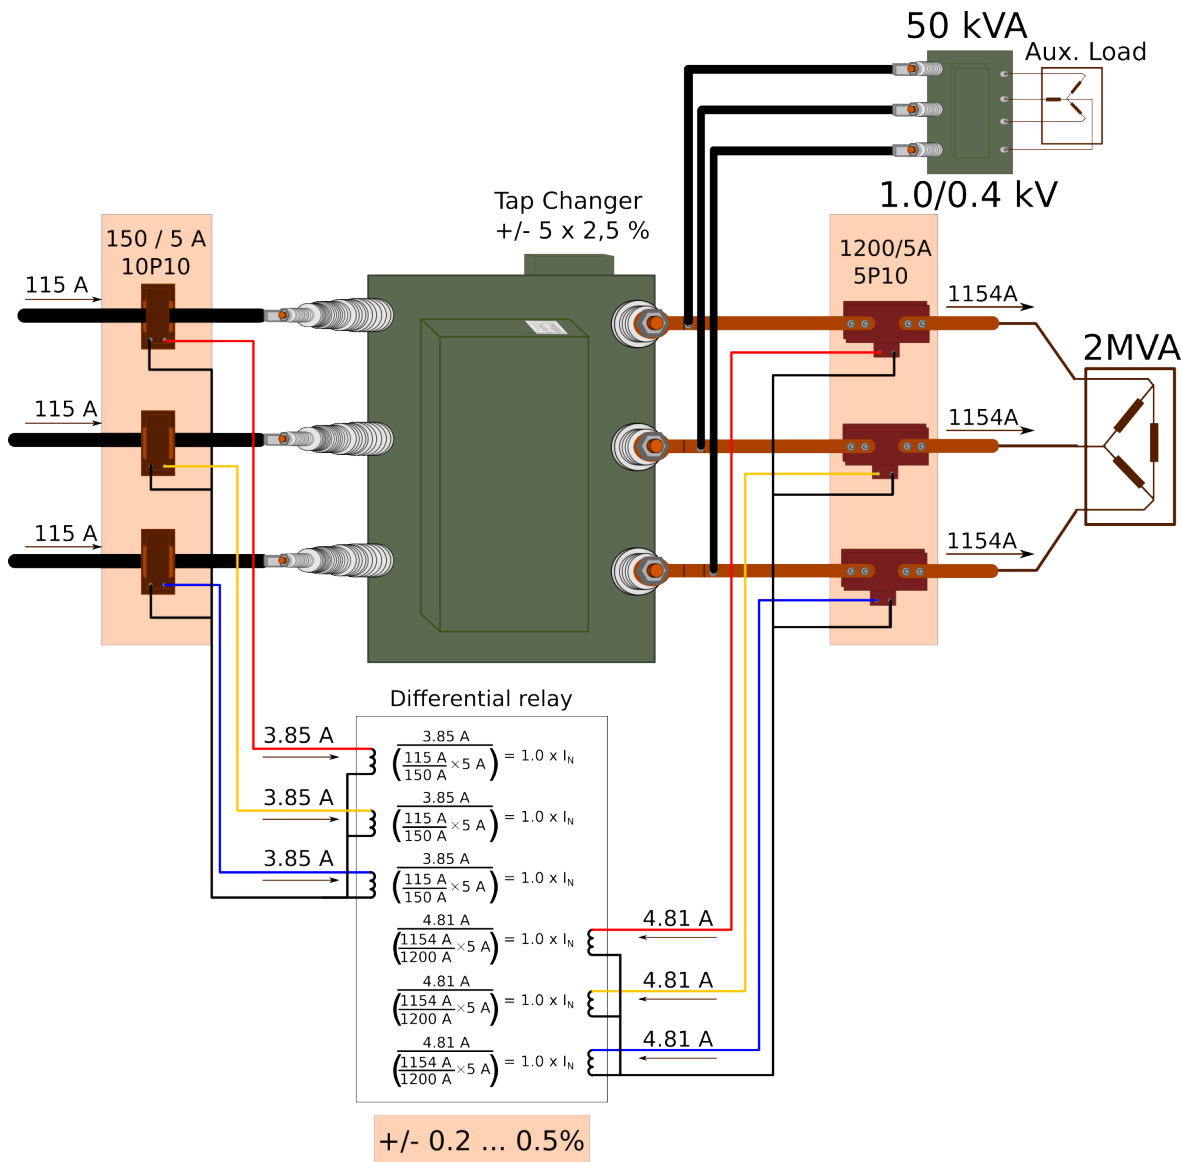

$$Diff_{bias < TP1} = I_{d>pick-up}$$

This is the first straight line which represents the differential current created by the transformer's normal operation. It takes into account measurement errors, possible variations caused by the transformer's tap changer (if available), and the various reasons why the application might have caused a different load inside the protected differential zone. In differential relays this is known as the pick-up current ($I_{d>pick-up}$). It is the basic sensitivity limit: when the measured differential current is below this limit, the transformer still operates normally and the protection does not trigger. In other words, the pick-up current setting must be higher than the combination of all the normal operation factors that cause differential currents.

Differential current sources (normal operation)

When calculating the differential current in a basic situation, it is strongly recommended to consider the following transformer component errors (the illustrated parts in the image below).

Figure. 4.4.10 - 114. Differential current sources (normal operation).

There seven (7) differential current sources for normal operation:

1) Primary side CT measurement accuracy (CTE_{pri})

In this example the primary side CTs are Class 10P, which means the measurement error is 10 %.

2) Secondary side CT measurement accuracy (CTE_{sec})

In this example the secondary side CTs are Class 5P, which means the measurement error is 5 %.

3) Protection relay measurement accuracy (primary and secondary) (RE_m)

The protection relay measurement error is below 0.5 %, its optional accuracy below 0.2 % per measurement channel: the combined value for both sides is either 1 % or 0.4 %.

4) Possible auxiliary transformer or auxiliary winding, currents not measured separately (AUTE)

In this example a 50 kVA auxiliary transformer is connected to the LV side output before the CTs, and this needs to be noted in the calculations. The same is true when the transformer itself is connected to auxiliary power output and those currents are not measured. The auxiliary power output's effect can be calculated by calculating the percentage of the auxiliary transformer/winding VA in relation to the transformer nominal VA (see formula below; assumes the auxiliary load to be nominal):

$$AUTE = \frac{AUX}{NOM} \times 100 \% = \frac{50\,000\text{ VA}}{2\,000\,000\text{ VA}} \times 100 \% = 2.5 \%$$

5) Transformer core magnetizing current (TME)

Transformer magnetizing current is the current which flows in the primary winding. Since it is running only in the primary side, this needs to be taken into account in the settings calculations. The approximate magnetizing current value can be calculated according to the following formula:

$$I_{TM} = \frac{U_{PRI}}{j\omega L_P}$$

When the primary inductance is known, the magnetizing current value is compared to the HV side's nominal current and the resulting percentage is directly the TME value. If the transformer's primary inductance is unknown, one can use a conservative estimate of 3 % as the TME value.

6) Safety margin (SME)

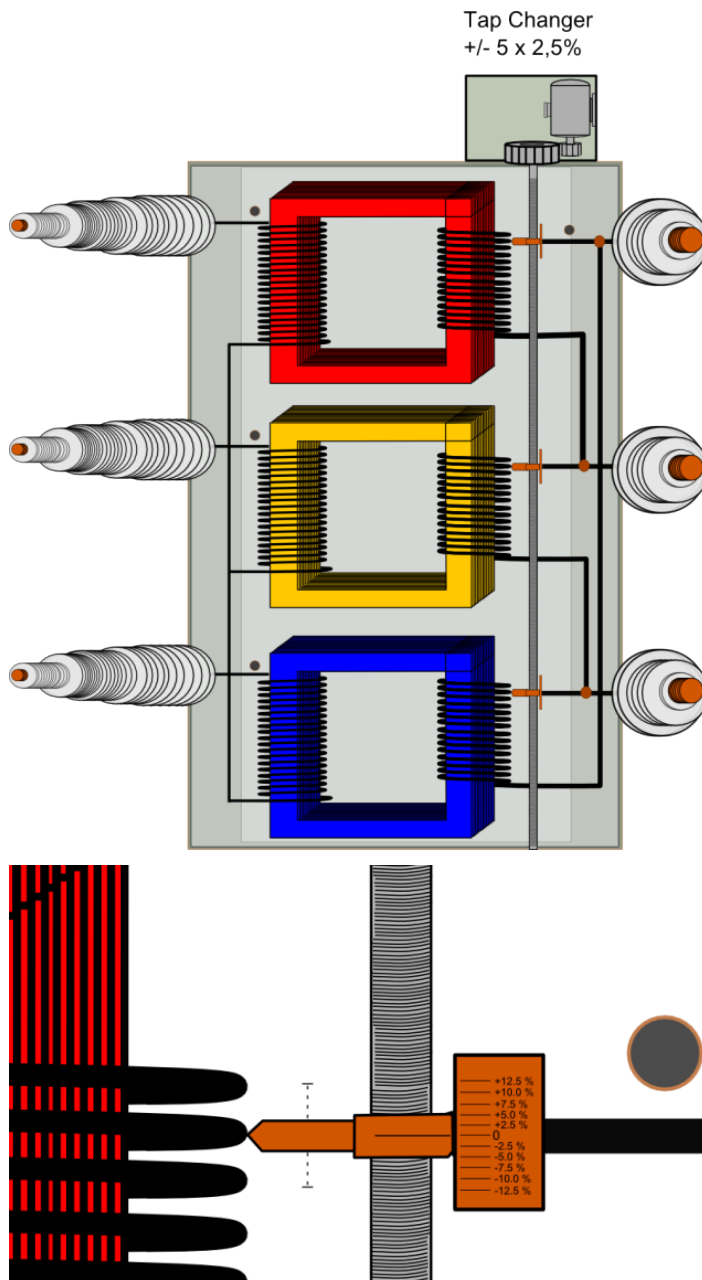

Conservative settings typically use a safety margin up to 5 %.

7) Tap changer on load side (TCE)

This example transformer has a tap changer with the rating of $\pm 5 \times 2.5 \%$. This means that the secondary side windings can be set $\pm 5 \times 2.5 \%$ from the nominal center position, causing a maximum deviation of $5 \times 2.5 \%$ from the nominal conditions. Therefore the TCE is 12.5 % in this case. Please note that the tap position is not always in the nominal center position: check the application and calculate the maximum effect to the worst side.

Generally the tap changer means that the transformer transformation ratio can be adjusted in order to receive the nominal voltage more accurately to the secondary side of the transformer. There are multiple reasons for voltage variations, e.g. heavy or light loading in the HV side. In practice this means that if the secondary side needs more or less voltage, the secondary side uses more or less winding rounds. This causes a difference in the nominal current condition, which can be noticed as a differential current in the protection relay. Usually tap changer positions are presented as deviation steps for the secondary voltage to both positive and negative direction from the center (see the second image below).

Figure. 4.4.10 - 115. Transformer tap changer.

*Calculating the generated differential current — The biased settings*

Now we have all the necessary data to calculate a naturally generated differential current based on the known errors and possible variables.

First we need to calculate the maximum uncertainty ($I_{\text{meas,unc}}$) from the various magnitudes inside the transformer. In this example, the transformer has a tap changer that affects the internal currents; however, its effects cannot be estimated reliably and the current's maximum uncertainty needs to be calculated. If there is no tap changer, the maximum uncertainty can be calculated sufficiently enough by summing the maximum inaccuracies of the CTs on the HV and LV sides.

$$I_{\text{meas,unc}} = \frac{\text{absolute uncertainty}}{\text{absolute measurement}} \times 100$$

Looking at the formula above, one can see that the absolute maximum uncertainty as well as the absolute measurement are needed. The former is the sum of the primary CT error (CTE_{pri}), the secondary CT error (CTE_{sec}), the tap changer maximum error (TCE) and the product of multiplying the secondary CT error with the tap changer maximum error ($CTE_{sec} \times TCE$). The latter is the sum of the so-called expected value ($1 \times I_n$) and the tap changer maximum error (TCE). The images below show the full formula (on the left) as well as the formula and its result when filled with the figures from our example configuration (on the right):

$$I_{meas,unc} = \frac{CTE_{pri} + CTE_{sec} + TCE + (CTE_{sec} \times TCE)}{1 + TCE} \times 100 \quad I_{meas,unc} = \frac{0.1 + 0.05 + 0.125 + (0.05 \times 0.125)}{1 + 0.125} \times 100 = 25 \%$$

The calculation result (25 %) presents the maximum caused differential current to nominal that can be caused by the transformer's properties. If we know other uncertainties, they can now be added to $I_{meas,unc}$ to get the following operation:

$$I_{db>pick-up} = I_{meas,unc} + (2 \times RE_m) + AUTE + TME = 25 \% + (2 \times 0.5 \%) + 2.5 \% + 3 \% = 31.5 \%$$

This means that in the worst case scenario, the differential current flows while the transformer's operation is normal. This is why the final result usually gets an added safety margin: the stable operation of the differential protection must be ensured and possible calculation errors negated. The following image shows the base sensitivity (i.e. the minimum setting for the differential current that the relay operation requires) given to the differential protection characteristics:

$$I_{db>pick-up} = \left(\frac{CTE_{pri} + CTE_{sec} + TCE + CTE_{sec} \times TCE}{1 + TCE} \times 100 \right) + 2 \times RE_m + AUTE + TME + SME = 36 \%$$

Now the base sensitivity takes into account the starting situation (no load to Turnpoint 1) in the characteristics. Next, it needs to be decided where to set **Turnpoint 1**. In most of differential relays this point is either fixed or automatically defined based on the base sensitivity and Slope 1; however, in this type of differential relay this point can be set by the user. If the user wants a high sensitivity, TP1 can be set to $1 \times I_n$ since the calculated base sensitivity already factors in the tap changer effect and all other differential current sources that normal operating causes. If the user prefers coarse settings, TP1 can be set to $0.5 \times I_n$, even $0.01 \times I_n$. The limit is determined by the sum of the protection principle the user wants. A smaller value results in a conservative and stable operation, while a larger value results in a highly sensitive but possibly unstable protection.

Please note that if TP 1 is set to $0.01 \times I_n$, Slope 1 starts directly from the setting and no unbiased sensitive section is available. This is useful when the user does not want base sensitivity to include the tap changer effect, but instead have it be accounted for in Slope 1 directly. This can lead to optimal sensitivity and stable settings for a differential relay even if there are no non-biased sensitive section in the characteristics. In this case, the formula to calculate the base sensitivity is as follows:

$$I_{db>pick-up} = CTE_{pri} + CTE_{sec} + 2 \times RE_m + AUTE + TME + SME$$

$$I_{db>pick-up} = 10 \% + 5 \% + 2 \times 0.5 \% + 2.5 \% + 3 \% + 5 \% = 26 \%$$

Next are the **Slope 1** settings, which present the protection relay's restrain characteristics over the transformer's load current range. This slope should be effective up to the maximum transformer loading. This value for power transformers is usually around 1.0 to $2.0 \times I_n$; for large power transformer a typical value is $1.5 \times I_n$. The purpose is to compensate the measurement errors caused by a relatively high current, including the tap changer effect. Slope 1 is calculated by using the transformer and CT nominal values in the maximum full load (Turnpoint 2) of the transformer with highest possible differential current causing tap position. Generally the Slope 1 setting is calculated as follows:

$$Slope\ 1 = \frac{I_{diff\ TP2}}{I_{bias\ TP2}} \times 100\ \%$$

Now the calculation of the maximum differential current in **Turnpoint 2** includes the previously calculated correction factors for the HV and LV side CTs.

$$I_{pu\ PRI\ HV} = \frac{I_{nHV}}{CT_{PRI\ HV}} = \frac{115.47\ A}{150\ A} = 0.77$$

$$I_{pu\ PRI\ LV} = \frac{I_{nLV}}{CT_{PRI\ LV}} = \frac{1154.7\ A}{1200\ A} = 0.96$$

Also is needed the corrected transformation ratio effect (TR_{corr}) due to the tap changer position on the maximum voltage position (usually this generates the highest differential current).

$$TR_{corr} = \frac{U_{HV\ VOLTS\ MIN}}{U_{HV}} \times \left(\frac{U_{HV}}{U_{LV}} \right)$$

To get the HV volts minimum value the user needs to apply the calculation on a situation when the tap changer on the secondary side is at maximum output voltage and the output is nominal. In this example we had a maximum of +12.5% increasing effect from the tap changer, resulting in the following calculation:

$$TR_{corr} = \frac{10\ 000\ V \times (1.0 - 0.125)}{10\ 000\ V} \times \left(\frac{10\ 000\ V}{1\ 000\ V} \right) = 8.75$$

Next we calculate the the currents that flow in the HV and LV sides, when the loading of the transformer is e.g. 1.5 times its rated power.

Therefore, the LV side currents are as follows:

$$I_{LV} = \frac{I_{nLV} \times 1.5}{CT_{LV\ SEC} \times I_{pu\ PRI\ LV} \times \left(\frac{CT_{LV\ PRI}}{CT_{LV\ SEC}} \right)} = \frac{1154.7\ A \times 1.5}{5\ A \times 0.96 \times \left(\frac{1200\ A}{5\ A} \right)} = 1.5 \times I_n$$

The currents of the HV side are as follows:

$$I_{HV} = \frac{\left(\frac{I_{nLV} \times 1.5}{TR_{corr}} \right)}{CT_{HV\ SEC} \times I_{pu\ PRI\ HV} \times \left(\frac{CT_{HV\ PRI}}{CT_{HV\ SEC}} \right)} = \frac{\left(\frac{1154.7\ A \times 1.5}{8.75} \right)}{5\ A \times 0.77 \times \left(\frac{150\ A}{5\ A} \right)} = 1.7 \times I_n$$

These currents present the worst-case scenario that the tap changer effect can cause to the differential relay's measured currents.

Next, we need to calculate the differential current. In theory there are two ways to use biasing calculation to do this, but in practice only one: the results of add and subtract modes are the same because they just compensate the connected CTs differently (starpoint towards or away from the transformer). Thus, the differential current is always calculated as follows:

$$|I_{HV} - I_{LV}|$$

This gives the absolute difference in the measured currents.

If the user wants more sensitive settings, the Average mode is selected and the Slope 1 calculation is as follows:

$$L_{x \text{ BIAS AVG}} = \frac{|I_{Lx \text{ HV}}| + |I_{Lx \text{ LV}}|}{2}$$

$$\text{Slope 1} = \frac{I_{diff \text{ TP2}}}{L_{x \text{ BIAS AVG}}} \times 100 \% = \frac{|I_{LV} - I_{HV}|}{\left(\frac{|I_{LV}| + |I_{HV}|}{2}\right)} \times 100 \% = \frac{1.5 - 1.7}{\left(\frac{1.5 + 1.7}{2}\right)} \times 100 \% = 12.5 \%$$

If the user wants more stable settings, the Maximum mode is selected and the Slope 1 calculation is as follows:

$$L_{x \text{ BIAS MAX}} = \max(|I_{Lx \text{ HV}}|, |I_{Lx \text{ LV}}|)$$

$$\text{Slope 1} = \frac{I_{diff \text{ TP2}}}{L_{x \text{ BIAS max}}} \times 100 \% = \frac{|I_{LV} - I_{HV}|}{\max(|I_{LV}|, |I_{HV}|)} \times 100 \% = \frac{1.5 - 1.7}{1.7} \times 100 \% = 11.7 \%$$

If the user wants to be on the safe side, yet another safety margin (in addition to the 5 % already in the base sensitivity settings) can be added to ensure stability.

At this point the only setting still missing is that of **Slope 2**. This setting is used for biasing the differential characteristics against heavy faults outside the differential zone that can cause heavy saturation on one or both sides of the CTs causing heavy differential current in the measurements even though the transformer itself does not have a fault. Please note that if there is a heavy end fault causing the biasing current to increase, this setting should not be set to maximum as the biasing may block the differential characteristics. This makes the trip not applicable even if there is an end fault.

When the transformer is fed from the HV side and the differential current is direct, the fault that feeds the end current can be accounted in the Slope 2 setting.

If the Average mode is used for biasing (due to a single end fault), the bias current is calculated as follows:

$$L_{x \text{ BIAS AVG}} = \frac{|I_{Lx \text{ HV}}| + |0|}{2}$$

Therefore, the differential current is the following:

$$|I_{Lx \text{ HV}}|$$

$$\text{Slope 2} = \frac{|I_{Lx \text{ HV}}|}{\frac{|I_{Lx \text{ HV}}|}{2}} \times 100 \% = \frac{|1|}{\left(\frac{1}{2}\right)} \times 100 \% = 200 \%$$

If the Maximum mode is used for biasing (due to a single end fault), the bias current is the same as the differential current. Therefore, the Slope 2 setting is calculated as follows:

$$\text{Slope 2} = \frac{|I_{Lx HV}|}{|I_{Lx HV}|} \times 100 \% = \frac{|1|}{|1|} \times 100 \% = 100 \%$$

Calculating the generated differential current — The non-biased settings

Now that the biased characteristic is set, we consider the settings for the non-biased stage $I_{di>Pick-up}$.

The purpose of this stage is to ensure fast and selective tripping of faults inside the differential zone, and also to ensure a stable operation on heavy outside faults. This stage operates only on the measured absolute differential current and is not blocked by harmonics or bias restraints. The setting of the stage should be based on the weakest full saturation of the CT under worst-case fault conditions because then only the other side current is measured and all current seen is differential current.

Let us calculate the maximum three-phase short-circuit current on the LV side in our example case from earlier:

$$I_{3ph SC LV} = \frac{S_N}{\sqrt{3} \times Z_k} = \frac{S_N}{\sqrt{3} \times \left(\frac{U_{LV}^2}{S_N} \times \frac{Z_k \%}{100 \%} \right)} = \frac{2\,000\,000 \text{ VA}}{\sqrt{3} \times \left(\frac{10\,000 \text{ V}^2}{2\,000\,000 \text{ VA}} \times \frac{4.95 \%}{100 \%} \right)} = 23327 \text{ A}$$

On the HV side this current is seen as:

$$I_{3ph SC LV \rightarrow HV} = \frac{I_{3ph SC LV}}{\left(\frac{U_{HV}}{U_{LV}} \right)} = \frac{23\,327 \text{ A}}{\left(\frac{10\,000 \text{ V}}{1\,000 \text{ V}} \right)} = 2\,332 \text{ A}$$

Next, let us remind ourselves of the given CT ratings for our example:

CT_{pri,HV} = 150/5A (10P10)

CT_{pri,LV} = 1200/5A (5P10)

Now we can calculate the secondary currents:

$$I_{HV MAX} = \frac{I_{3ph SC LV \rightarrow HV}}{CT_{HV PRI}} = \frac{2\,332 \text{ A}}{\frac{150 \text{ A}}{5 \text{ A}}} = 77.7 \text{ A}_{SEC} (20.18 \times I_n)$$

$$I_{LV MAX} = \frac{I_{3ph SC LV}}{CT_{HV PRI}} = \frac{23\,327 \text{ A}}{\frac{1\,200 \text{ A}}{5 \text{ A}}} = 97.2 \text{ A}_{SEC} (20.2 \times I_n)$$

This is the theoretical maximum of the current flowing in the CTs, when a bolted and symmetrical three-phase fault occurs in the LV side of the transformer. Based on the previous calculations, we can see that the HV side maximum current is approximately 15 times higher than the CT rating, and the LV side appr. 19 times higher. No full CT saturation should be seen in either side even though the accuracy limit factor for both CTs is ten times the nominal. The protection class information in the CT ratings tell us that the CT output is for both CTs ten times the rated current in their given measurement class (5 % and 10 %, respectively). However, this is related to the nominal burden that is normally very high compared to the CT input in modern protection relays.

Next, the real CT accuracy limit factor needs to be checked in both CTs, in both sides. This check has much important initial data: the VA of the CTs on both sides, the length of the wiring between the relay and the CTs, the connection between the CTs, as well as the cross-section and material of the wires. Let us begin with the burden the wiring causes to the relay, and calculate the resistance in a conductor:

$$R_{Cond} = \frac{\rho \times l}{A}, \text{ where}$$

R_{Cond} = resistance of conductor (Ω)
 ρ = resistivity of the conductor material (Ω / m)
 l = length of the wire in meters (m)
 A = cross-section of the conductor (m^2)

When designing the CTs and their wiring, please keep in mind the following: the resistance of the wire doubles when the length is doubled, and the resistance halves when the wire's cross-section are doubles. When 1 A secondary is used (instead of 5 A secondary), all burdens drop to a level smaller to portion of $5A^2$, e.g. 1/25.

Although copper cables are normally used to connect CTs to a protection relay, the table below also presents the resistivity (rho) and conductivity (sigma) properties of aluminum (at +20 °C):

Material	ρ ($\Omega \cdot m$) at 20 °C (68 °F, 293 K)	σ (S/m) at 20 °C	Temperature coefficient (K ⁻¹)
Copper	1.68×10^{-8}	5.96×10^7	0.003862
Aluminum	2.82×10^{-8}	3.5×10^7	0.0039

You can use the following formula to calculate the resistivity in temperatures other than +20 °C:

$$\Delta\rho = ((\alpha \times \Delta T) \times \rho_0), \text{ where}$$

$\Delta\rho$ = change of resistivity (Ω / m)
 α = temperature coefficient (K⁻¹)
 ΔT = temperature change ($t_1 - t_0$)
 ρ_0 = resistivity in given temperature (°C)

For example, the resistivity of copper at +75 °C is calculated like this:

$$\rho_0 + \Delta\rho = \rho_0 + (\alpha \times \Delta T \times \rho_0)$$

$$1.68 \times 10^{-8} + ((0.003862 \times (75^\circ\text{C} - 20^\circ\text{C})) \times 1.68 \times 10^{-8}) = 0.0203 \mu\Omega / m$$

With this value we can calculate the resistances (per meter) of the most commonly used copper wires given value most common used copper wires at +75 °C by using the above-mentioned formula for R_{Cond} :

Cross-section (mm^2)	Resistance (Ω/m)
1.5	0.0135
2.5	0.00812
4.0	0.00508
6.00	0.00338

It is recommended that you use the worst-case scenario as the basis for calculating the CT burden. In most cases these +75 °C values are sufficient. If the ambient temperature in your application is higher than +75 °C, the resistance should be calculated for that specific temperature.

It is also Important to know the wiring of the CTs: do the CTs have a common return wire or are both ends of both CTs wired to the terminal connector? Usually there are four wires coming from the CTs to the terminal: in these cases the length per phase is the sum of the distance from the CT to the relay and the distance from the relay OR from the CTs to the common coupling point. When both sides of all CTs are wired to the relay or to the terminal, the length of the wiring is double the distance from the CTs to the relay. If the connection is a combination of these two wiring types, the length can be estimated by increasing the distance in proportion to the six-wire or four-wire connection. For example, if six wires connecting the CTs to the terminal account for 30 % of the wiring (in addition to the four wires connecting the and the terminal), the estimated length of the wire is 1.3 times the distance between the relay and the CTs.

The next loading factor is the resistance of the relay's measuring input. In this relay type the resistance is 0.0005 for the current input, which gives approximately 0.001 VA with a current of 1 A. Then we need to calculate the accuracy limit factor (ALF). This requires the CT nominal ALF value and we can get that from the above-mentioned CT rating: the figure after P gives the current overload as a factor of the nominal rated value and therefore gives the ALF applicable at that overload of the CT. The actual ALF can be calculated with the following common method:

$$ALF_{act} = ALF_{rated} \times \left| \frac{S_{ctrn} + S_{rated}}{S_{ctrn} + S_{actual}} \right|$$

, where
 ALF_{rated} = the rated accuracy limit factor, the "factor after P"
 S_{ctrn} = internal burden of the CT secondary (VA)
 S_{rated} = the rating of the CT (VA)
 S_{actual} = the actual power taken from the CT (VA)

The main issue with this equation is the S_{CTRn} , the internal burden of the CT secondary. The internal resistance is related to the CT rating, to the winding length as well as to the dimensions of the wire used in the winding. Some CT manufacturers include the SCTRn value in their product documentation. However, as the value is only a small portion of the CT burden as a whole (the wirings cause most of it in typical relay applications), one should not worry if the value is unknown.

For example, let us assume that the internal resistance of the CT's HV side is 0.05 Ω and is rated 5 VA, and that the internal resistance of the CT's LV side 0.09 Ω , also rated 5 VA. The wiring from the HV side to the relay is 10 m and from the LV side to the relay 5 m; both sides have 30% of the wiring made with a six-wire connection and 70% of the wiring with a four-wire connection. The wirings on both sides are made with 4 mm² wires. The HV side is 150/5 A, with the protection class 10P10; the LV side is 1200/5 A, with the protection class 5P10. Therefore, the actual accuracy limit factor on both sides is as follows (the HV side on the left, the LV side on the right):

$ALF_{rated} = 10$ $S_{rated} = 5 \text{ VA}$ $S_{ctrn} = I_{NS}^2 \times CT_{RS} = 5^2 \text{ A} \times 0.05 \Omega = 1.25 \text{ VA}$ $R_{wire} = (10 \text{ m} \times 1.3) \times 0.00508 \frac{\Omega}{\text{m}} = 0.066 \Omega$ $S_{actual} = I_{NS}^2 \times (R_{wire} + R_{relay}) = 5^2 \text{ A} \times (0.066 \Omega + 0.0005 \Omega) = 1.65 \text{ VA}$ $ALF_{act} = ALF_{rated} \times \left \frac{S_{ctrn} + S_{rated}}{S_{ctrn} + S_{actual}} \right = 10 \times \left \frac{1.25 \text{ VA} + 5 \text{ VA}}{1.25 \text{ VA} + 1.65 \text{ VA}} \right = 21.55$	$ALF_{rated} = 10$ $S_{rated} = 5 \text{ VA}$ $S_{ctrn} = I_{NS}^2 \times CT_{RS} = 5^2 \text{ A} \times 0.09 \Omega = 2.25 \text{ VA}$ $R_{wire} = (5 \text{ m} \times 1.3) \times 0.00508 \frac{\Omega}{\text{m}} = 0.033 \Omega$ $S_{actual} = I_{NS}^2 \times (R_{wire} + R_{relay}) = 5^2 \text{ A} \times (0.033 \Omega + 0.0005 \Omega) = 0.838 \text{ VA}$ $ALF_{act} = ALF_{rated} \times \left \frac{S_{ctrn} + S_{rated}}{S_{ctrn} + S_{actual}} \right = 10 \times \left \frac{2.25 \text{ VA} + 5 \text{ VA}}{2.25 \text{ VA} + 0.838 \text{ VA}} \right = 23.5$
--	--

When comparing the corrected CT accuracy limit factors to the estimated maximum through fault currents, we can see that the current will not saturate the CTs. The HV side can repeat the current $21.6 \times I_n$, while the calculated HV through fault current is at maximum $20.2 \times I_n$. The same is true for the LV side where the maximum output is $20.2 \times I_n$ when the LV side CT is able to repeat $23.5 \times I_n$. From this we can expect that through faults will not cause problems with this power transformer and CT combination. It also shows us that the non-biased differential stage can be set to operate sensitively during in-zone faults. If the CTs have the possibility to saturate (that is, the calculated through fault current is bigger than the ALF on either CT side), the setting of the instant stage must be set high enough so that it does not operate on through fault saturation.

The inrush peak current should also be considered when setting the instant stage. In normal-power transformers the energizing inrush current may be $10 \times I_n$, while the measured current is FFT-filtered for the fundamental frequency which is used for differential calculation. Typically, the found differential current is half of the maximum peak current. The instant stage should be $5 \times I_n$ if the setting should be according to the theoretical maximum and the margin. Conservative settings should use the $10 \times I_n$. The setting value should never cause trips for energizing, but still operate fast during energizing fault cases. This stage is usually never blocked in applications, and therefore the stage settings should consider the absolute differential current that is possible in normal operations while keeping the settings sensitive enough for inrush currents (especially in energizing cases).

Thus, the setting suggestion for this $I_{di>Pick-up}$ stage is $6.0 \times I_n \dots 10 \times I_n$ for sensitive and conservative operations respectively.

Finalising the settings

Now the basic settings for the differential stages are applied and the differential protection is ready to operate. Our example transformer is very small but the formulas presented in this manual can be applied to transformers of all sizes. If so selected, the relay automatically calculates these settings (using these same formulas) in the Transformer status monitoring (TRF) module. When everything is set up correctly in the relay and when the transformer is feeding the load with nominal power, the result should look like the following example configuration when the example settings and transformer are used.

Figure. 4.4.10 - 116. Example configuration for the transformer differential function.

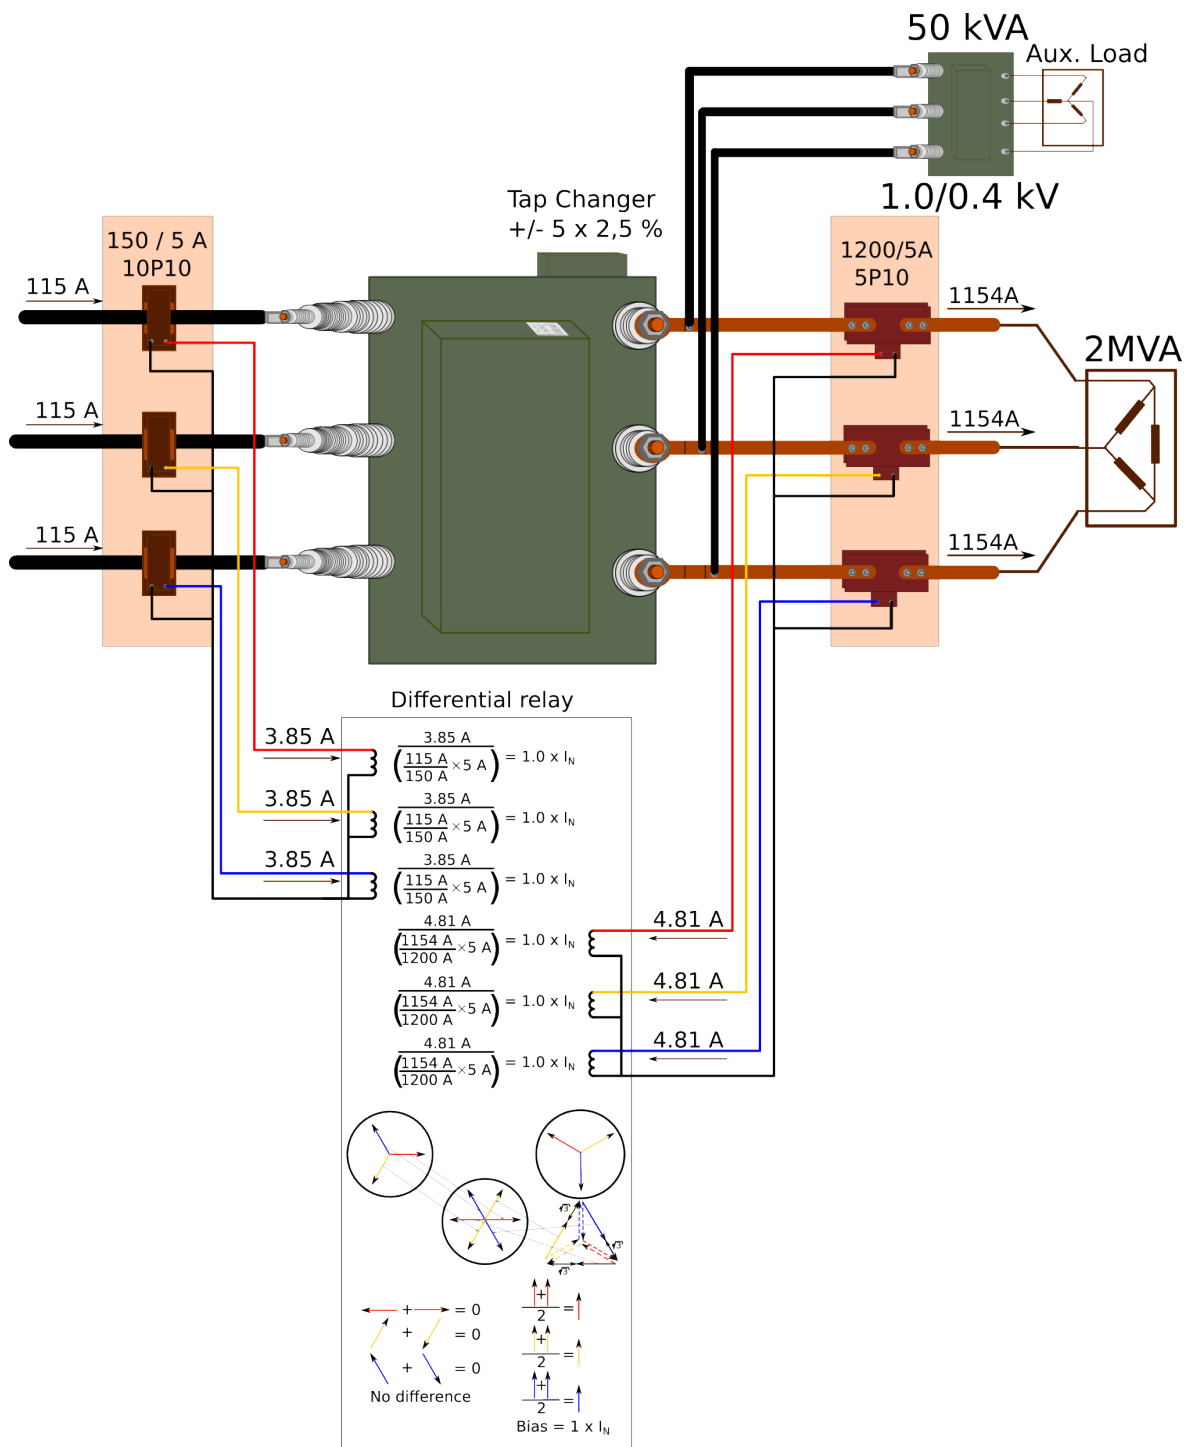

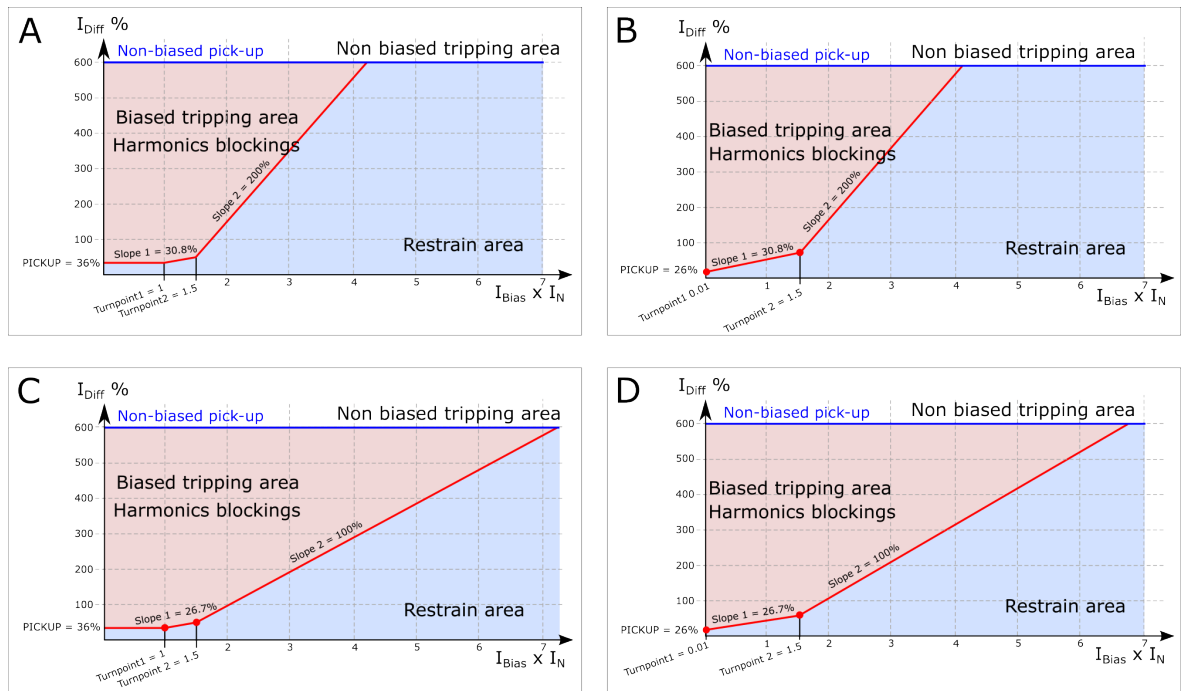

Figure. 4.4.10 - 117. Example differential characteristics

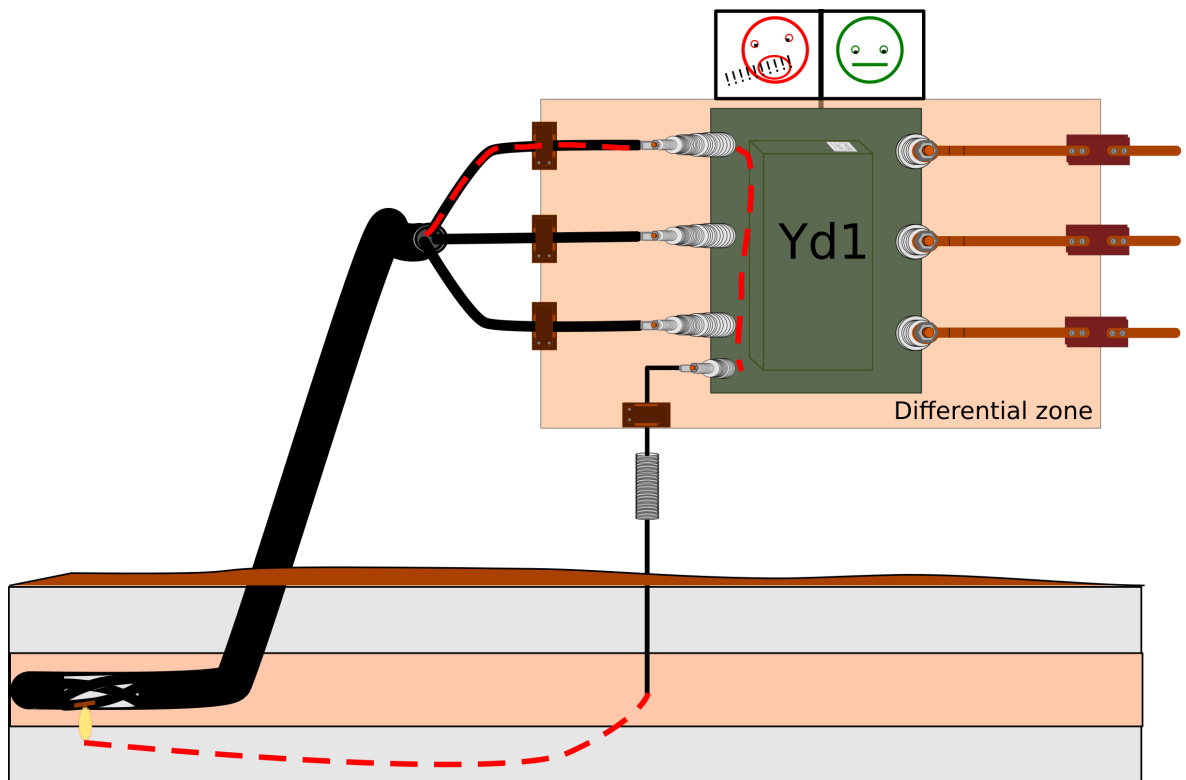

The four characteristics (the image above) present the setting variations based to the Average restraint calculation mode (figures A and B) and the Maximum restraint calculation modes (figures C and D). The characteristics are set to be equally sensitive in each of them. You can also see the variations in Turnpoint 1 settings: in Figures A and C it is set at $1.0 \times I_N$, whereas in Figures B and D it is set at $0.01 \times I_N$.

Zero sequence compensation for external earth faults

Our example presented only one type of transformer and its properties. Another very common variation is the type of transformer where the star side (HV, LV, or both) is earthed and thus forms a route outside the differential zone (see the image below).

Figure. 4.4.10 - 118. Transformer earthing settings that do not compensate for external earth faults.

The differential relay looks at this situation and sees a fault inside the differential zone. This is because the other side is not affected at all by the fault (or only very little), and the relay sees a high current entering but not exiting the zone.

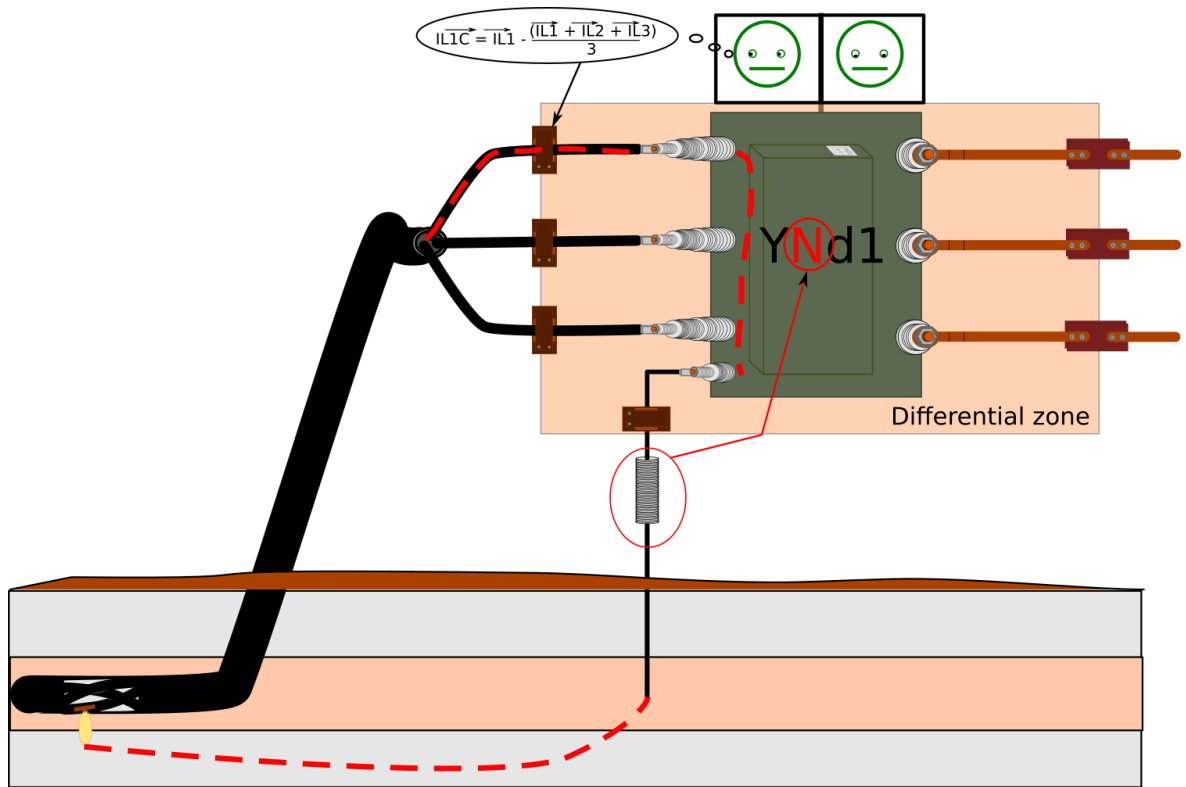

In many cases the zero sequence current is monitored by the CT in the earthing.

Earthing (directly or via a resistor) forms a route outside the differential zone.

When an external earth fault happens, only the earthed side of the transformer is involved in the fault.

The differential earthing requires the earthing to be known: if not compensated, any low-impedance earth fault outside the differential zone causes a differential current and possibly trips the differential protection. This is why the calculated zero sequence compensation is used. The vector group selection has either "N" or "n" to signify either HV side or LV side earthing. The selection then deducts the calculated zero sequence current from the currents (in p.u.) before differential calculation and thus negates the effect of an external earth fault. Correctly selected transformer settings prevent the differential function from being tripped by out-of-zone earth faults (see the image below).

Figure. 4.4.10 - 119. Transformer earthing settings that compensates for external earth faults.

When the transformer settings are correct, the differential relay compensates the zero sequence current and does not trip due to earth faults outside the differential zone.

Earthing (directly or via a resistor) forms a route outside the differential zone.

When an external earth fault happens, only the earthed side of the transformer is involved in the fault.

The "N" or "n" selection applies the correction and eliminates the zero sequence effect with the following formulas:

$$\vec{I}_{L1_{corr}} = \vec{I}_{L1} - \frac{\vec{I}_{L1} + \vec{I}_{L2} + \vec{I}_{L3}}{3}$$

$$\vec{I}_{L2_{corr}} = \vec{I}_{L2} - \frac{\vec{I}_{L1} + \vec{I}_{L2} + \vec{I}_{L3}}{3}$$

$$\vec{I}_{L3_{corr}} = \vec{I}_{L3} - \frac{\vec{I}_{L1} + \vec{I}_{L2} + \vec{I}_{L3}}{3}$$

Note! When you enable the zero sequence compensation by selecting the "N" or "n" in the transformer vector group, the sensitivity to single-phase one end fault decreases by a third simultaneously. This is why restricted earth fault protection ($I_{0>}$, REF) should be enabled for the side where the zero sequence is compensated. However, enabling the REF protection requires that both the phase current measurements and the starpoint current are available and can be connected to the relay's residual current channel on the corresponding (HV/LV) side measurement.

Restricted earth fault

When the transformer's earthed side is compensated with afore-mentioned zero sequence compensation, that side will be a third (appr. 33 %) less sensitive in detecting single-phase faults inside the differential zone. For this reason it is advised that the restricted earth fault (REF) stage is activated on the transformer side that compensates the zero sequence current. Additionally, it should be enabled whenever the Y side of the starpoint is earthed; normal phase differential protection cannot be set to provide the maximum sensitivity to detect single-phase (earth) faults within the differential area because the properties dependant on the transformer and the application that were described in the previous section. This differential stage monitors the incoming calculated residual current and compares it to the outgoing starpoint current. If the single-phase (earth) fault occurs outside the differential zone, this function does not operate; if the fault occurs inside the differential zone, this function operates quickly. This protection's sensitivity to earth faults only within the protection zone is referred to as the "restricted earth fault protection".

The transformer differential functions offers two stages of low-impedance, restricted earth fault protection.

The operating characters of the restricted earth fault function ($I_{0d>}$) on both the high voltage and the low voltage side are more similar to each other than to the percentage characteristics presented by the $I_{db>}$ function, even though both sides are independent and can be set freely. The calculation of differential and biasing currents on both sides is as follows (the HV side on the left, the LV side on the right).

$HV_{I_{0d} \text{ bias avg}} = \frac{ (\overline{IL1}_{HV} + \overline{IL2}_{HV} + \overline{IL3}_{HV}) + \overline{I0}_{HV \text{ meas}} }{2}$	$LV_{I_{0d} \text{ bias avg}} = \frac{ (\overline{IL1}_{LV} + \overline{IL2}_{LV} + \overline{IL3}_{LV}) + \overline{I0}_{LV \text{ meas}} }{2}$
$HV_{I_{0d} \text{ bias max}} = \max((\overline{IL1}_{HV} + \overline{IL2}_{HV} + \overline{IL3}_{HV}), \overline{I0}_{HV \text{ meas}})$	$LV_{I_{0d} \text{ bias max}} = \max((\overline{IL1}_{LV} + \overline{IL2}_{LV} + \overline{IL3}_{LV}), \overline{I0}_{LV \text{ meas}})$
$HV_{I_{0d> \text{ diff add}}} = (\overline{IL1}_{HV} + \overline{IL2}_{HV} + \overline{IL3}_{HV}) + \overline{I0}_{HV \text{ meas}} $	$LV_{I_{0d> \text{ diff add}}} = (\overline{IL1}_{LV} + \overline{IL2}_{LV} + \overline{IL3}_{LV}) + \overline{I0}_{LV \text{ meas}} $
$HV_{I_{0d> \text{ diff subtract}}} = (\overline{IL1}_{HV} + \overline{IL2}_{HV} + \overline{IL3}_{HV}) - \overline{I0}_{HV \text{ meas}} $	$LV_{I_{0d> \text{ diff subtract}}} = (\overline{IL1}_{LV} + \overline{IL2}_{LV} + \overline{IL3}_{LV}) - \overline{I0}_{LV \text{ meas}} $

Similarly to the phase differential stages, both sides with the restricted earth fault stages have options between the average and the maximum bias current calculation, as well as the option between the add and the subtract current calculation. The use of these stages depends on the CTs' installation directions and the desired sensitivity for bias calculation.

In the transformer differential stage the reference current for the REF protection is always the protected side nominal current, which is calculated in the relay's Transformer status monitoring (TRF) module.

The transformer REF stage (regardless of the side) may be set to be a lot more sensitive than the phase differential. The setting sensitivity should be defined by whether or not one expects CT saturation (transformer's maximum single-phase output compared to the neutral point CT ratings). The tripping characteristics may be set differently when the network is earthed either directly or through impedance, and therefore the fault current may be expected to saturate the CTs even during external faults. For this reason there are three sections also in the REF function characteristics (non-biased, slightly biased, and heavily biased). For high-impedance or close-to-neutral winding faults the first (non-biased) section should consider the CTs' possible measurement errors as well as the desired sensitivity for internal faults close-to-neutral. The Turnpoint 1 setting should be twice the CT's nominal current. Normally the setting calculation is guided by the primary-to-maximum current rating because the CTs' neutral point has a lower primary current rating than the phase current. The first biased section (that is, Slope 1) should consider how a possible saturation in the CTs' neutral point affects normal (external) earth faults, and the how a heavy fault going fully through the second biased section (Slope 2) can cause saturation in the CTs' phase currents.

The recommended base settings:

- Pick-up (base sensitivity): typically 5 % to 10 % of the phase current CT error (Px)
- Turnpoint 1: double the neutral current CT nominal primary to transformer nominal current ratio
- Slope 1: calculate the maximum single-phase through fault overcurrent to nominal ratio and used biasing mode ratio
- Turnpoint2: set to maximum accuracy limit factor to transformer nominal ratio of the neutral point CT (typically 5 or 10); if the single-phase overcurrent fault exceeds this value, set Turnpoint 2 to that value
- Slope 2: set the maximum restraint calculation mode to 100 % and the average mode to 200 %.

Blockings from harmonics (2nd and 5th)

In transformer protection harmonics are always present in energizing situations: they are generated by the high current in the transformer inductances when the coils are energized. They are also present in the currents during overfluxing and overvoltage situations. Energizing situations generate even harmonics: the 2nd harmonic is the most commonly used harmonic in inrush blocking. Overvoltage (and overexcitation) situations generate odd harmonics: the 5th harmonic is mainly used for blocking (the 3rd harmonic is also present in Y windings but absent in delta windings which is why the 5th harmonic has been chosen for overfluxing and excitation detection). In this chapter 'blocking' refers to the ldb> (the biased differential) stage and it has both these blocking (2nd and 5th) applied internally. If the ldi> stage (the non-biased differential) needs to be blocked, external blocking must be used.

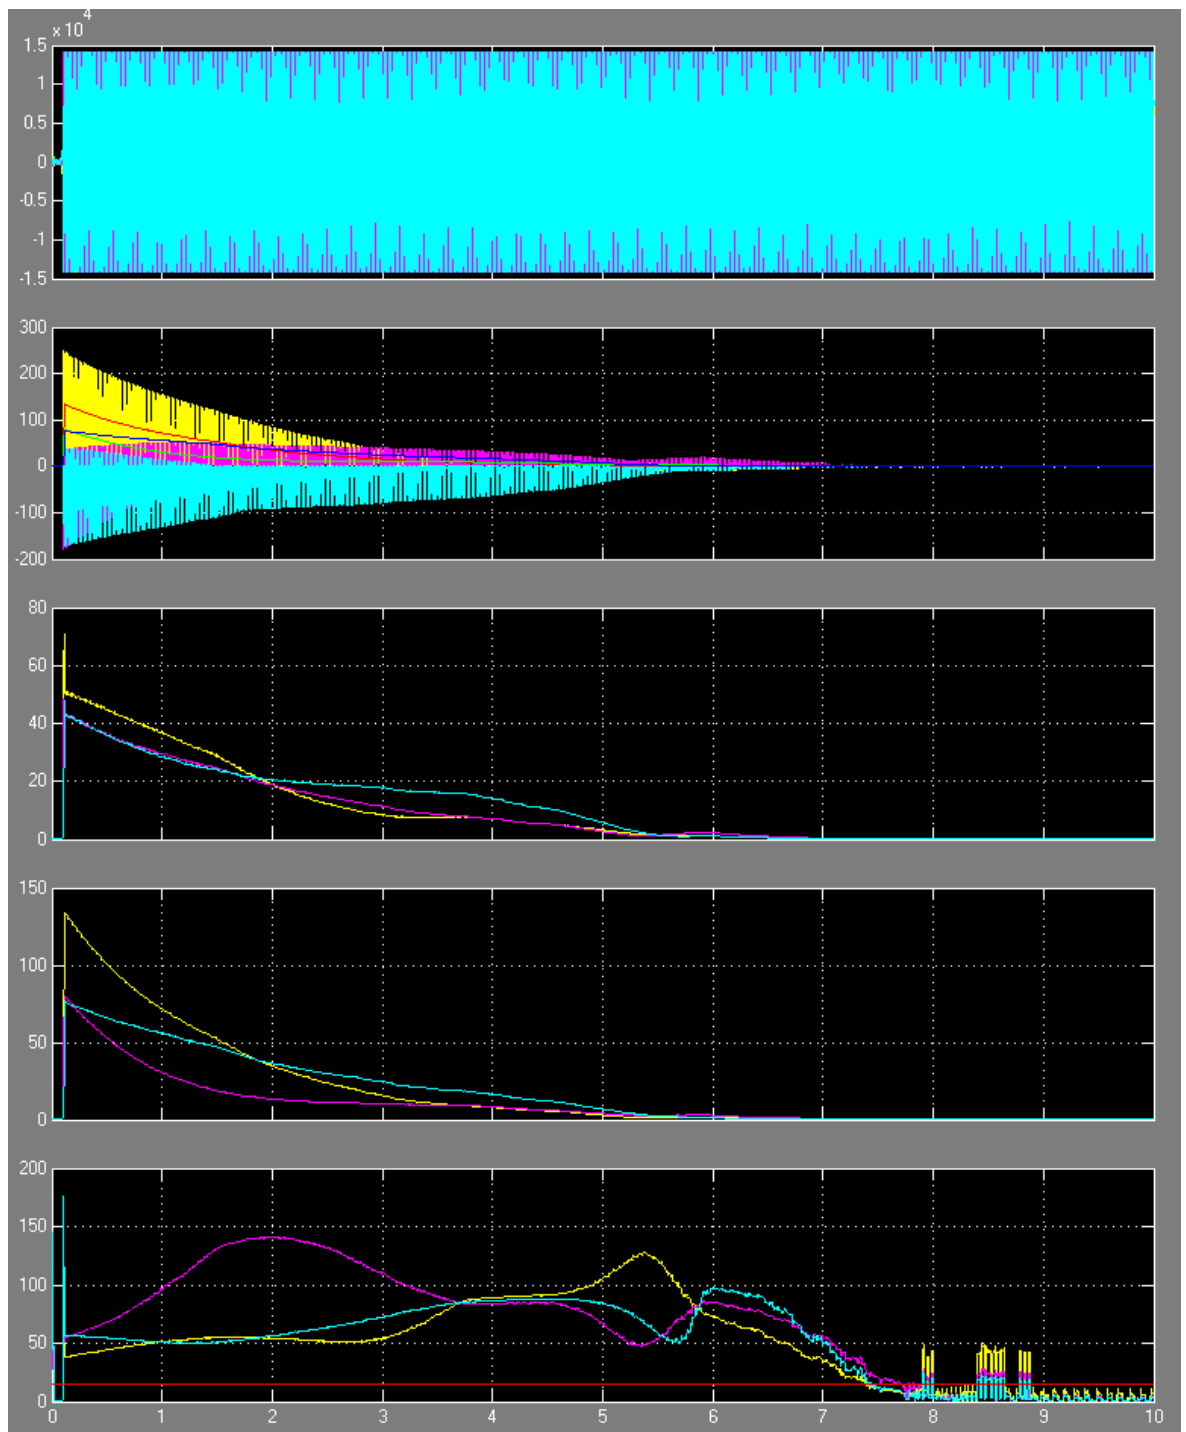

2nd harmonic for magnetizing inrush blocking (principle and usage)

When the primary side of a power transformer is energized (secondary side open), the transformer acts as a simple inductance. During normal operation the flux produced in the transformer core lags behind the fed voltage by 1.58 radians (90 degrees). This means that when the voltage is in zero crossing, the steady state value of the flux is in its negative or positive maximum value. In energizing situations there is no flux available at the instant the winding is energized because there is no (live) magnetic flux linked to the transformer core prior to switching on the supply (however, remanence flux may still exist). The flux reaches its steady state operation some time after energization (depends on the transformer's properties such as its size, its R/X ratio, etc.). In practice this means that the flux in the transformer core starts from zero, as does the voltage in the winding; when energizing the transformer's primary side, the flux ends up 90 degrees behind the winding voltage and the system is in a steady state.

This start-up transition in the transformer has the effect of making the flux value be double the nominal flux value in the first half of the cycle after energization. The transformer core is generally saturated just above the steady state value of the flux and because of this the transformer core is decreasingly saturated during the transition time. During this saturation time the transformer's primary side draws a very high current with a heavy amount of even harmonics (the highest being the 2nd). This current is called the "magnetizing inrush current in transformer". The inrush current can be up to ten times higher than the nominal rated current of a transformer. The energizing characteristics of a transformer depend on the ratings of the transformer as well on the transformer's design (limb constructions, etc.).

The differential relay sees the energization current as a differential current since it only flows through the primary side winding only. The saturation of the transformer core generates the 2nd harmonic component which can be used to block the biased sensitive differential stage during energization.

Figure. 4.4.10 - 120. Energizing behavior of a small transformer.

The figure above presents the energizing behavior of a small transformer. The first graph depicts the applied voltage, the second graph depicts the phase currents' peak and FFT values (as mentioned earlier, the calculated FFT value is about 50% of the peak value), the third graph depicts the 2nd harmonic absolute values (in amperes), the fourth graph depicts the fundamental (50 Hz) FFT-calculated currents (in amperes), and fifth graph depicts the 2nd harmonic components relative to the corresponding fundamental component currents (with the 15 % setting limit).

The magnetizing inrush current in a 2 MVA transformer is over quickly, in about seven seconds. Afterwards there is still the nominal measurable current (seen only in the transformer's primary side) which would cause the differential relay to trip if energized without magnetizing the inrush blocking. Looking at the currents more closely one can see that the input values of the fundamental frequency currents (used for differential calculations) are roughly as follows:

$$I_{L1\ peak} = 140\ A = 1.2 \times I_n$$

$$I_{L2\ peak} = 75\ A = 0.65 \times I_n$$

$$I_{L3\ peak} = 70\ A = 0.60 \times I_n$$

In our previous example the transformer's nominal current on the HV (primary) side was 115.5 A; with it we can count the following:

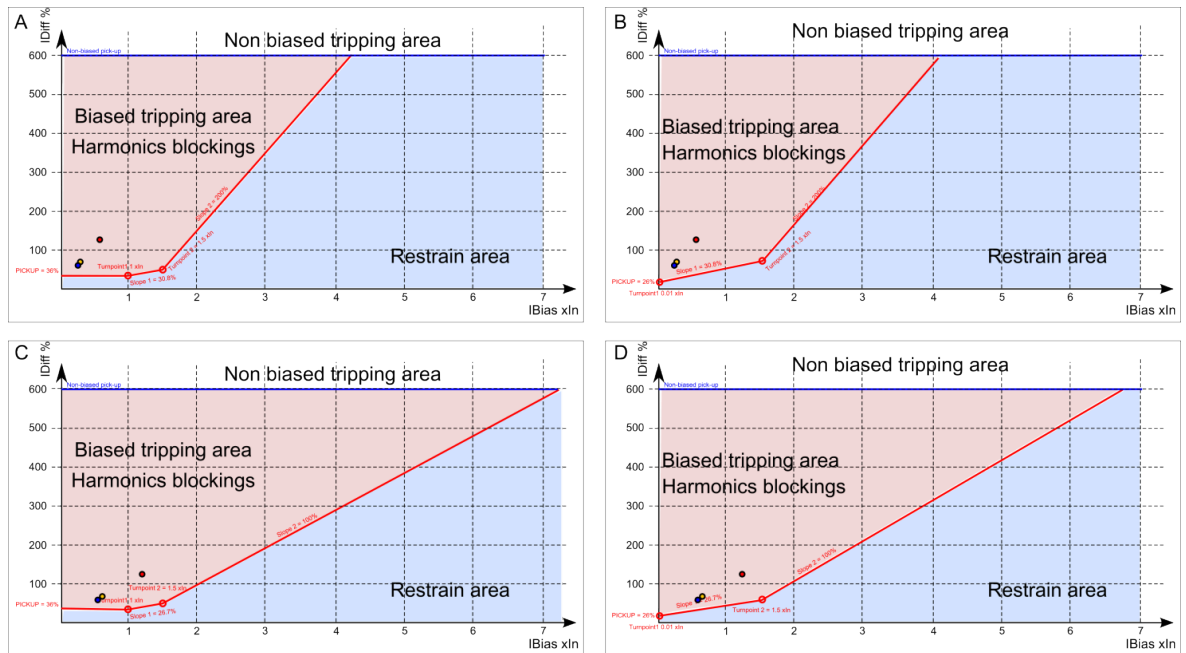

$$I_{L1\ diff} = 120\ \%,\ I_{L1\ bias\ avg} = \frac{1.2 \times I_n}{2} = 0.6 \times I_n,\ I_{L1\ bias\ max} = 1.2 \times I_n$$

$$I_{L2\ diff} = 65\ \%,\ I_{L2\ bias\ avg} = \frac{0.65 \times I_n}{2} = 0.33 \times I_n,\ I_{L2\ bias\ max} = 0.65 \times I_n$$

$$I_{L3\ diff} = 60\ \%,\ I_{L3\ bias\ avg} = \frac{0.60 \times I_n}{2} = 0.30 \times I_n,\ I_{L3\ bias\ max} = 0.60 \times I_n$$

The graph below shows how the differential currents look like when used in the set characteristics.

Figure. 4.4.10 - 121. Differential currents in the energization of a 2 MVA transformer.

While the results are very low compared to the magnetizing inrush current magnitudes, the differential relay would still definitely trip without the 2nd harmonic blocking. The situation is the same with all of the calculated setting variations.

The following figure presents the principle operation of the harmonic blocking in the transformer differential. When the transformer is energized, both the fundamental frequency and the 2nd harmonic increase significantly. In this example the harmonic blocking limit was set to 15 % (the ratio between the 2nd harmonic and the fundamental frequency, all phases), which seems more than sufficient for this transformer. The pick-up in the example is set to 30 %. Now, when the flux in the transformer core starts to catch up, the saturation in the core is reduced and the current for magnetizing is reduced as well. The blocking remains active until the setting is reached after which the blocking is released for each phase separately. With our example transformer the harmonic blocking limit could be set to 30 % and the energizing would still be successful because the 2nd harmonic is still heavily present by the time the fundamental currents are reduced below the differential stage's pick-up limit.

Figure. 4.4.10 - 122. Inrush blocking by using the 2nd harmonic (relative to fundamental frequency).

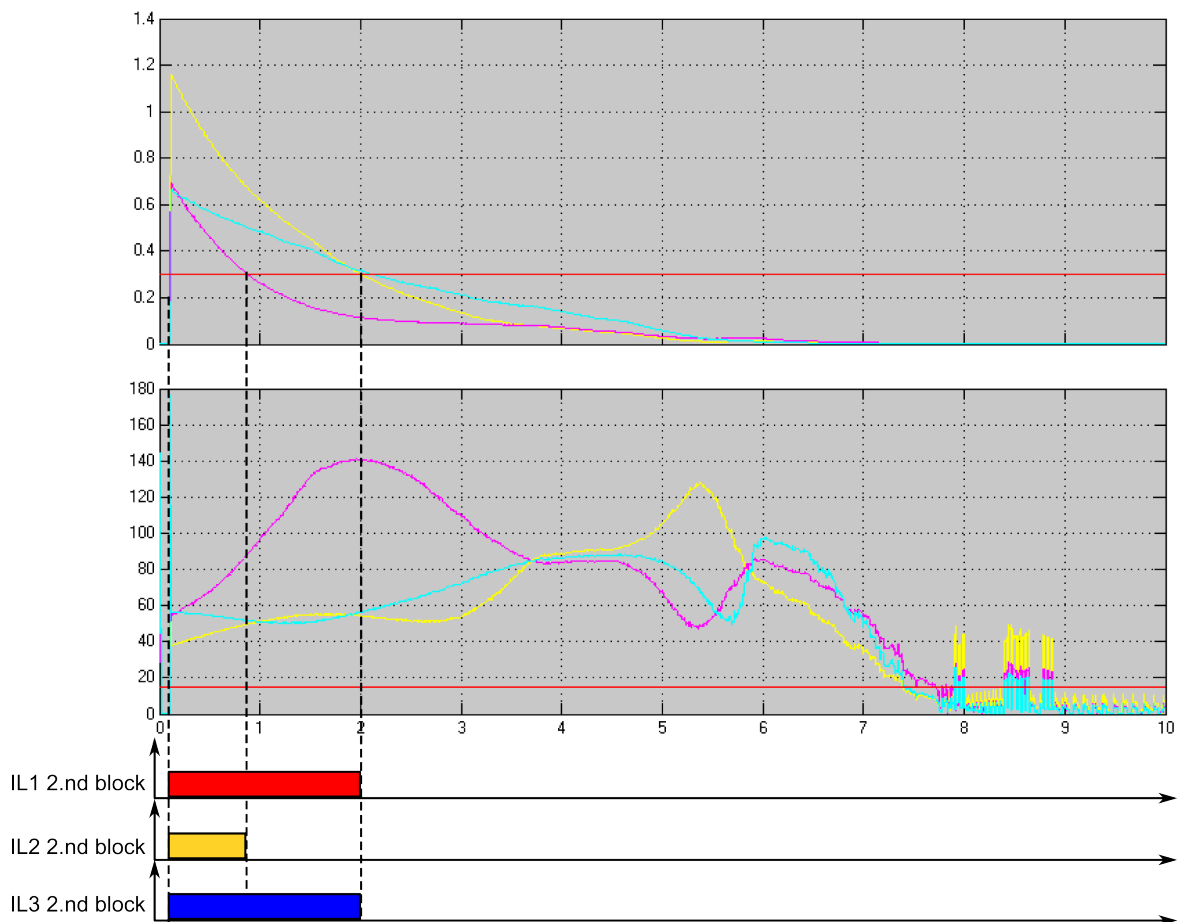

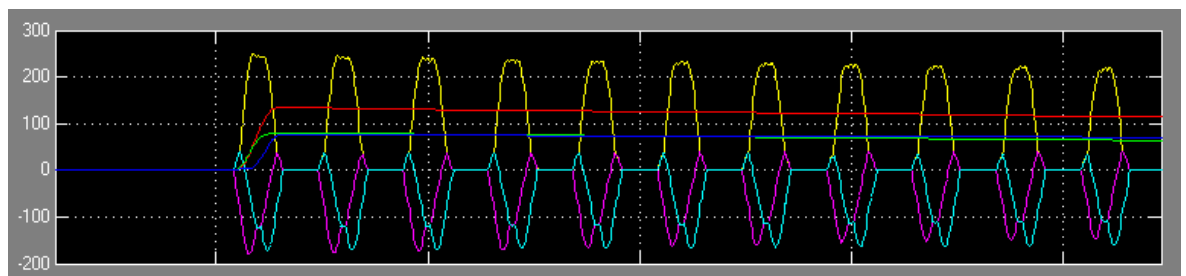

Figure. 4.4.10 - 123. Example of transformer magnetizing inrush currents.

A conservative setting recommendation for standard type transformers:

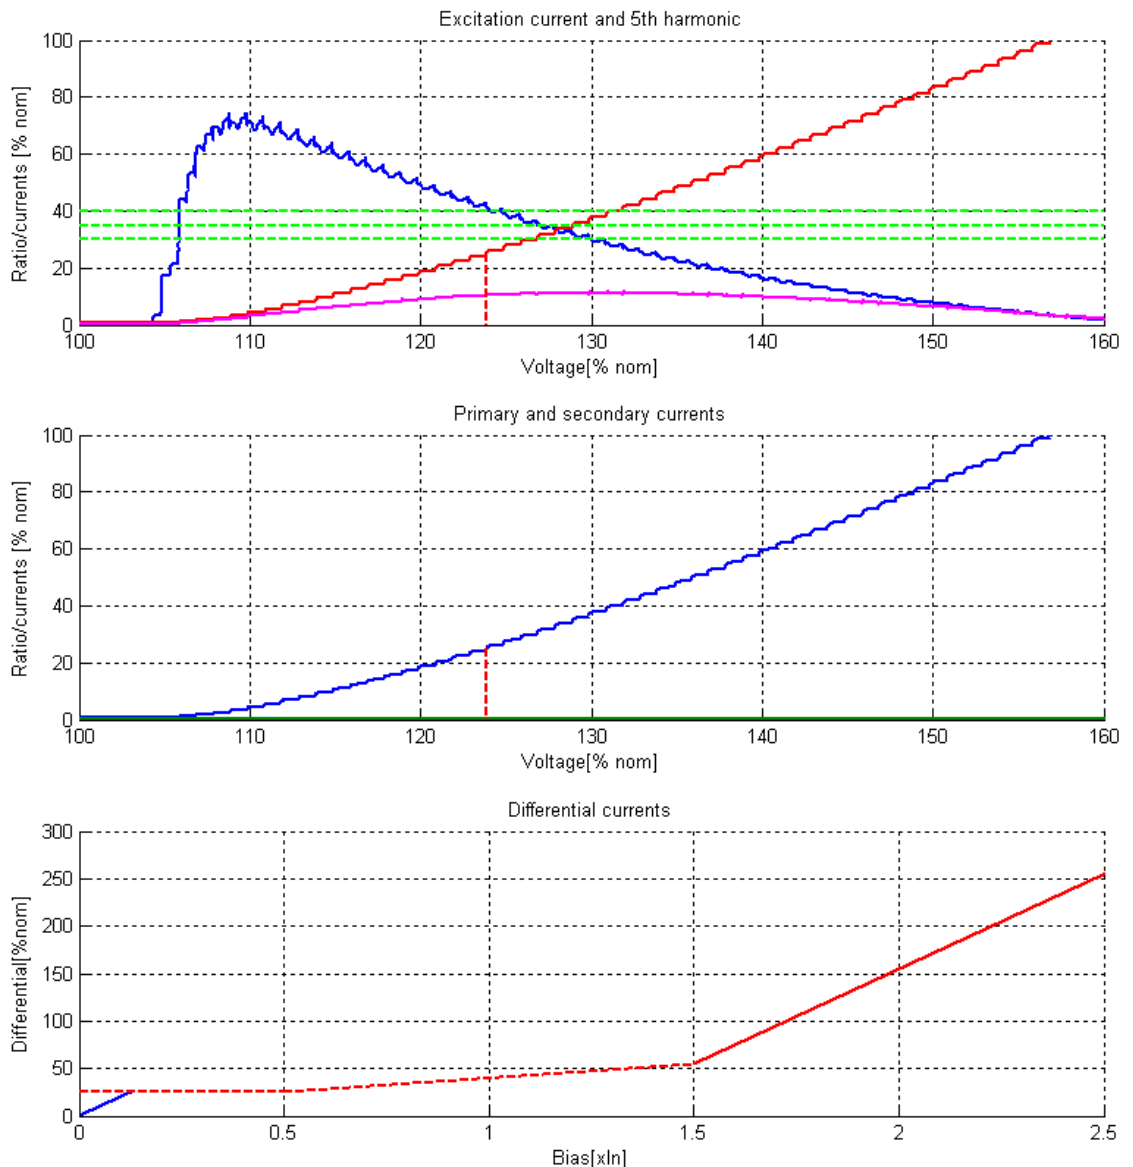

- enabling the 2nd harmonic blocking
- sensitivity appr. 15...20 %
- harmonic content compared to the fundamental frequency.

The user can fine-tune the transformer settings during the commissioning phase if there are any issues with the transformer energization.

5th harmonic for overexcitation blocking (principle and usage)

When the transformer's primary side voltage increases for some reason, the voltage-frequency (V/f) ratio exceeds the desing limits and the transformer overexcited very quickly. This may be caused by two things: a fault in the LV side can throw off the loading and cause a temporary overvoltage, or the frequency in the network decreases for some reason (e.g. overloading or generation drop). The differential relay should not trip in either of these cases even though the overexcitation in the transformer's core result in the primary side measured currents being higher than those on the secondary side.

Figure. 4.4.10 - 124. Transformer behavior in case of overvoltage caused by overexcitation.

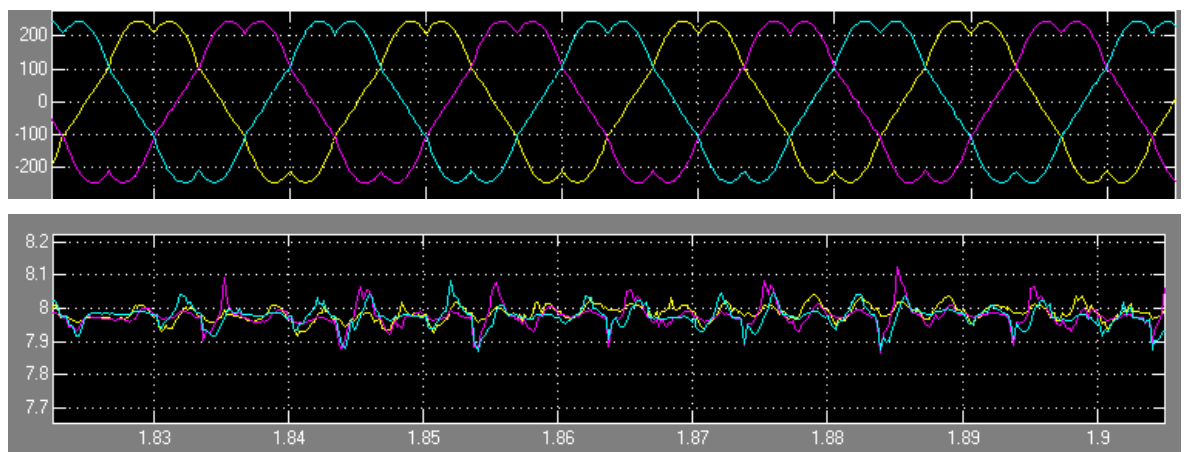

The figure above presents the simulated behavior of a power transformer when overvoltage occurs. In the simulation the transformer was unloaded on the secondary side while the voltage on the primary side was increased with a ramp. The first graph depicts the excitation current, the 5th harmonic component and their relation (which is used in the blocking); the green lines represents the suggested setting limits for 5th harmonic detection (30 %, 35 %, and 40 %). The second graph depicts the primary and secondary currents, plotted as a function of the voltage. The third graph depicts the differential characteristics as well as the differential and bias currents.

As can be noted from the first graph, the 5th harmonic component begins increasing rapidly (compared to the fundamental) in the start situation when the voltage is about 120 % of the nominal (depends entirely on the transformer properties and its saturation characteristics). This behavior is common to all transformers: when the core starts to be saturated there is a heavy amount of the 5th harmonic in the magnetizing current. When the overvoltage exceeds a certain point in the magnetizing characteristics, the 5th harmonic remains; however, the fundamental component of the current starts to grow very rapidly and as a result the relation of the 5th harmonic to fundamental decreases rapidly as a function of the primary side voltage. The growing magnetizing current is only seen on the transformer's primary side and the differential relay sees it as pure differential current. From the third graph we can see that the differential pick-up setting is reached when the voltage is approximately 125 % of the nominal value. This means that the differential current generated by the overexcitation could trip the transformer, as the ratio between the 5th harmonic and the fundamental magnitude decreases. If the overvoltage were, for example, 130 % of the nominal value, no blocking would be available; even the differential current would be greatly over the setting limit (appr. 40 % vs. the set 25 %). Nevertheless, this behavior can still be considered to be correct for the power transformer because an overvoltage like this can cause many serious problems and therefore tripping is desired.

The figures below present example waveforms of a transformer that is running with a 200 % rated voltage with the corresponding ratio between the 5th harmonic and the fundamental frequency component.

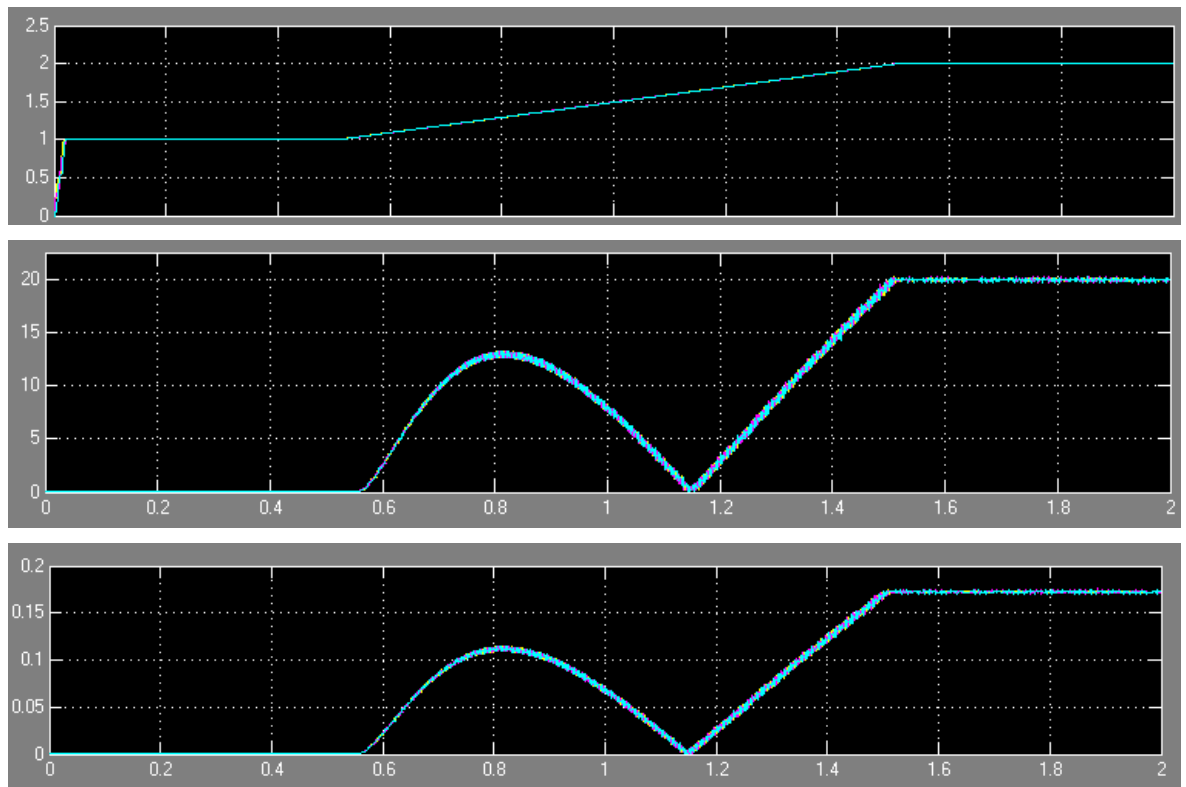

Figure. 4.4.10 - 125. Example waveforms.

Traditionally, the ratio between the 5th harmonic and the fundamental frequency component has been used in blocking the differential relay from tripping in overvoltage and overexcitation situations. However, the ratio is not a reliable method because you need to know the magnetizing properties and the hysteresis values exactly in order to set it correctly and for it to be of any use.

The figures below present the system voltage and the magnitude of the 5th harmonic component (both in per-unit), absolute and scaled to the transformer nominal.

Figure. 4.4.10 - 126. System voltage and magnitude of the 5th harmonic component.

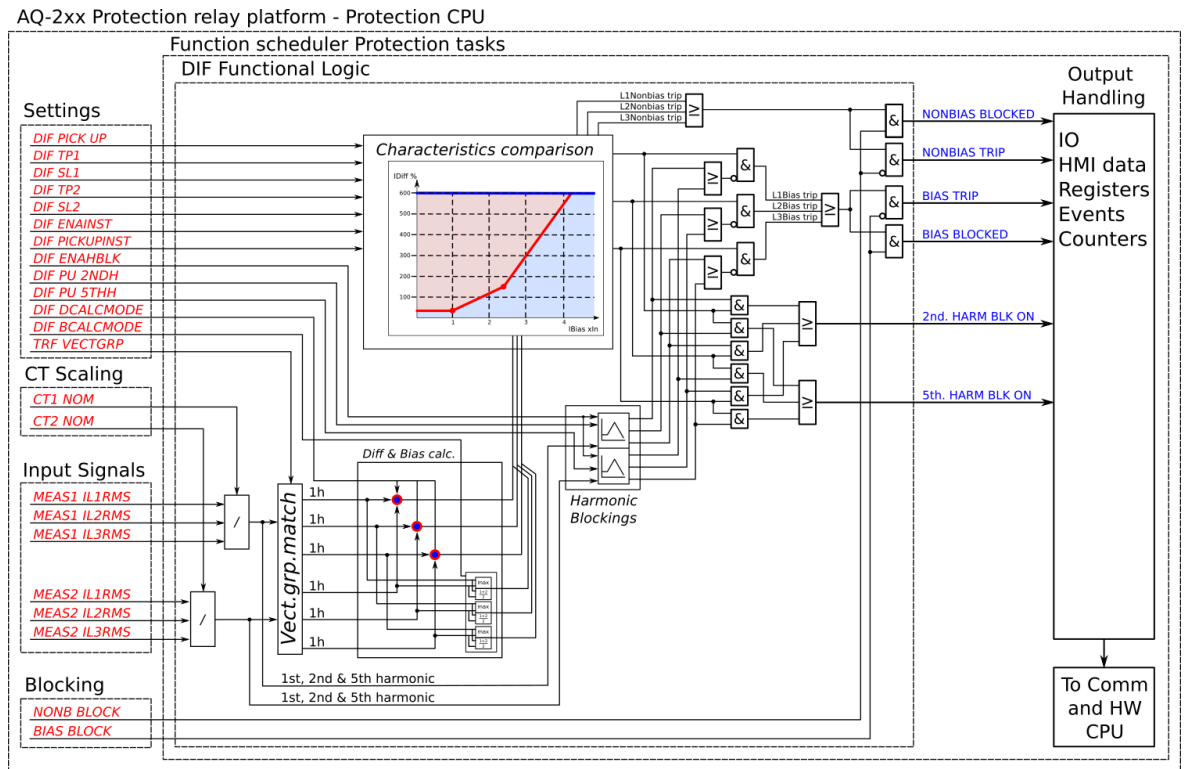

As can be seen in the figure above, the 5th harmonic component first increases, then decreases and then increases again as the system voltage rises. In this case the 5th harmonic seems to disappear completely when around an overvoltage of 160 %. When the harmonic behaves this way, the previously mentioned blocking can be used as it automatically blocks on a smaller overvoltage (in case there is any differential current) and releases when the overvoltage is too heavy and the differential current is most probably over the tripping limit.

However, one should note that the behavior of this blocking is very unpredictable if the exact saturation characteristic and the transformer design are not known. If there is a chance that the overexcitation can cause problems (that is, no overvoltage relays are available), this blocking can be enabled with the setting of 30...40 % with the disturbance recorder enabled. If a trip occurs as a result of overexcitation, the settings can be adjusted based on the data captured by the disturbance recorder.

Differential function details

Figure. 4.4.10 - 127. Simplified function block diagram of the transformer differential function.

The transformer differential function outputs TRIP and BLOCKED signals from the biased and non-biased functions as well as the 2nd and 5th harmonic block activation signals. These signals can be used in protection applications.

Settings and signals

The settings of the differential function are a combination of transformer monitor and differential stage function settings. The following table shows the function's settings, including the general settings (in p.u.) used for pre-calculations.

Table. 4.4.10 - 89. Settings related to the differential function's pre-calculation.

Name	Range	Step	Default	Function	Description

Events and registers

The transformer differential function (abbreviated "DIF" in event block names) generates events from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

The function's outputs can be used for direct I/O controlling and user logic programming. The function also provides a resettable cumulative counter for the TRIP, 2nd Harmonic Block, 5th Harmonic Block, External Block events.

Table. 4.4.10 - 93. Event messages.

4.4.11 Resistance temperature detectors (RTD)

Resistance temperature detectors (or RTDs) can be used to measure both temperatures of motors/generators and ambient temperatures. Typically an RTD is a thermocouple or of type PT100. Up to three (3) separate RTD modules based on an external Modbus are supported; each can hold up to eight (8) measurement elements. Up to two (2) separate RTD option cards are supported by this function. Sixteen (16) individual element monitors can be set for this alarm function, and each of those can be set to alarm two (2) separate alarms from one selected input. The user can set alarms and measurements to be either in degrees Celsius or Fahrenheit.

Figure. 4.4.11 - 128. Simplified function block diagram of the resistance temperature detection function.

Settings

Setting up an RTD measurement, the user first needs to set the measurement module to scan the wanted RTD elements. A multitude of Modbus-based modules are supported. Communication requires bitrate, databits, parity, stopbits and Modbus I/O protocol to be set; this is done at *Communication* → *Connections*. Once communication is set, the wanted channels are selected at *Communication* → *Protocols* → *ModbusIO*. Then the user selects the measurement module from the three (3) available modules (A, B and C), as well as the poll address. Additionally, both the module type and the polled channels need to be set. When using a thermocouple module, the thermo element type also needs to be set for each of the measurement channels. Once these settings are done the RTDs are ready for other functions.

Table. 4.4.11 - 95. Function settings for Channel x (Sx).

Name	Range	Step	Default	Description

S1...S16 Alarm2	-101.0...2000.0deg	0.1deg	0.0deg	Sets the value for Alarm 2. The alarm is activated if the measurement goes above or below this setting mode (depends on the selected mode in "Sx Alarm2 >/<").

Function can be set to monitor the measurement data from previously set RTD channels. A single channel can be set to have several alarms if the user sets the channel to multiple sensor inputs. In each sensor setting the user can select the monitored module and channel, as well as the monitoring and alarm setting units (°C or °F). The alarms can be enabled, given a setting value (in degrees), and be set to trigger either above or below the setting value. There are sixteen (16) available sensor inputs in the function. An active alarm requires a valid channel measurement. It can be invalid if communication is not working or if a sensor is broken.

When the RTDs have been set, the values can be read to SCADA (or some other control system). The alarms can also be used for direct output control as well as in logics.

Events

The resistance temperature detector function (abbreviated "RTD" in event block names) generates events and registers from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

The function's outputs can be used for direct I/O controlling and user logic programming. The function also provides a resettable cumulative counter for the ALARM events.

The function offers sixteen (16) independent stages; the events are segregated for each stage operation.

Table. 4.4.11 - 96. Event messages.

Event block name	Event names
RTD1	S1...S16 Alarm1 ON
RTD1	S1...S16 Alarm1 OFF
RTD1	S1...S16 Alarm2 ON

RTD1	S1...S16 Meas Ok
RTD1	S1...S16 Meas Invalid

4.4.12 Programmable stage (PSx>/<; 99)

The programmable stage is a stage that the user can program to create more advanced applications, either as an individual stage or together with programmable logic. The device has ten programmable stages, and each can be set to follow one to three analog measurements. The programmable stages have three available pick up terms options: overX, underX and rate-of-change of the selected signal. Each stage includes a definite time delay to trip after a pick-up has been triggered.

The programmable stage cycle time is 5 ms. The pick-up delay depends on which analog signal is used as well as its refresh rate (typically under a cycle in a 50 Hz system).

The number of programmable stages to be used is set in the *INFO* tab. When this function has been set as "Activated", the number of programmable stages can be set anywhere between one (1) and ten (10) depending on how many the application needs. In the image below, the number of programmable stages have been set to two which makes PS1 and PS2 to appear. Inactive stages are hidden until they are activated.

Please note that setting the number of available stages does not activate those stages, as they also need to be enabled individually with the *PSx >/< Enabled* parameter. When enabled an active stage shows its current state (condition), the expected operating time and the time remaining to trip under the activation parameters. If a stage is not active the *PSx>/< condition* parameter will merely display “Disabled”.

Setting group selection controls the operating characteristics of the function, i.e. the user or user-defined logic can change function parameters while the function is running.

Analog values

The numerous analog signals have been divided into categories to help the user find the desired value.

Table. 4.4.12 - 97. Phase and residual current measurements (IL1, IL2, IL3, Io1 and Io2)

Name	Description
ILx ff (p.u.)	Fundamental frequency RMS value (in p.u.)
ILx 2 nd h.	ILx 2 nd harmonic value (in p.u.)
ILx 3 rd h.	ILx 3 rd harmonic value (in p.u.)
ILx 4 th h.	ILx 4 th harmonic value (in p.u.)
ILx 5 th h.	ILx 5 th harmonic value (in p.u.)
ILx 7 th h.	ILx 7 th harmonic value (in p.u.)
ILx 9 th h.	ILx 9 th harmonic value (in p.u.)
ILx 11 th h.	ILx 11 th harmonic value (in p.u.)
ILx 13 th h.	ILx 13 th harmonic value (in p.u.)
ILx 15 th h.	ILx 15 th harmonic value (in p.u.)
ILx 17 th h.	ILx 17 th harmonic value (in p.u.)
ILx 19 th h.	ILx 19 th harmonic value (in p.u.)
ILx TRMS	ILx TRMS value (in p.u.)
ILx Ang	ILx Angle (degrees)

Table. 4.4.12 - 98. Other current measurements

Name	Description
IOZ Mag	Zero sequence current value (in p.u.)
IOCALC Mag	Calculated IO value (in p.u.)
I1 Mag	Positive sequence current value (in p.u.)
I2 Mag	Negative sequence current value (in p.u.)

Name	Description
I0CALC Ang	Angle of calculated residual current (degrees)
I1 Ang	Angle of positive sequence current (degrees)
I2 Ang	Angle of negative sequence current (degrees)
I01ResP	I01 primary current of a current-resistive component
I01CapP	I01 primary current of a current-capacitive component
I01ResS	I01 secondary current of a current-resistive component
I01CapS	I01 secondary current of a current-capacitive component
I02ResP	I02 primary current of a current-resistive component
I02CapP	I02 primary current of a current-capacitive component
I02ResS	I02 secondary current of a current-resistive component
I02CapS	I02 secondary current of a current-capacitive component

Table. 4.4.12 - 99. Voltage measurements

Name	Description

Ext RTD meas 1...8	External RTD measurement channels 1...8 (ADAM)
mA input 7,8,15,16	mA input channels 7, 8, 15, 16
ASC 1...4	Analog scaled curves 1...4

Magnitude multiplier

Programmable stages can be set to follow one, two or three analog measurements with the *PSx >/< Measurement setting* parameter. The user must choose a measurement signal value to be compared to the set value, and possibly also set a scaling for the signal. The image below is an example of scaling: a primary zero sequence voltage has been scaled to a percentage value for easier handling when setting up the comparator.

The scaling factor was calculated by taking the inverse value of a 20 kV system:

$$k = \frac{1}{20\,000\text{ V}/\sqrt{3}} = 0.008\,66$$

When this multiplier is in use, the full earth fault zero sequence voltage is 11 547 V primary which is then multiplied with the above-calculated scaling factor, inverting the final result to 100%. This way a pre-processed signal is easier to set, although it is also possible to just use the scaling factor of 1.0 and set the desired pick-up limit as the primary voltage. Similarly, any chosen measurement value can be scaled to the desired form.

Read-only parameters

The function's *Info* page displays useful, real-time information on the state of the protection function. It is accessed either through the device's HMI display, or through the setting tool software when it is connected to the device and its Live Edit mode is active.

Table. 4.4.12 - 106. Information displayed by the function.

Name	Range	Description
Condition	<ul style="list-style-type: none"> • Normal • Start • Trip • Blocked 	Displays status of the function.
Expected operating time	-1800.000...1800.000s	Displays the expected operating time when a fault occurs.
Time remaining to trip	0.000...1800.000s	When the function has detected a fault and counts down time towards a trip, this displays how much time is left before tripping occurs.
PSx Scaled magnitude X	-5 000 000...5 000 000	Displays measurement value after multiplying it the value set to <i>PSx Magnitude multiplier</i> .

Name	Range	Description
PSx >/< MeasMag1/ MagSet1 at the moment	-5 000 000...5 000 000	The ratio between measured magnitude and the pick-up setting.
PSx >/< MeasMag2/ MagSet2 at the moment	-5 000 000...5 000 000	The ratio between measured magnitude and the pick-up setting.
PSx >/< MeasMag3/ MagSet3 at the moment	-5 000 000...5 000 000	The ratio between measured magnitude and the pick-up setting.
PSx >/< CalcMeasMag/ MagSet at the moment	-5 000 000...5 000 000	The ratio between calculated magnitude and the pick-up setting.

Pick-up settings

The *Pick-up setting Mag* setting parameter controls the pick-up of the PSx>/< function. This defines the maximum or minimum allowed measured magnitude before action from the function. The function constantly calculates the ratio between the set and the measured magnitudes. The user can set the reset hysteresis in the function (by default 3 %). It is always relative to the *Pick-up setting Mag* value.

Table. 4.4.12 - 107. Pick-up settings.

Name	Range	Step	Default	Description
PS# Pick-up term Mag#	<ul style="list-style-type: none"> • Over > • Over (abs) > • Under < • Under (abs) < • Delta set (%) +/- > • Delta abs (%) > • Delta +/- measval • Delta abs measval 	-	Over	Comparator mode for the magnitude. See "Comparator modes" section below for more information.
PS# Pick-up setting Mag#/calc >/<	-5 000 000.0000...5 000 000.0000	0.0001	0.01	Pick-up magnitude
PS# Setting hysteresis Mag#	0.0000...50.0000%	0.0001%	3%	Setting hysteresis
Definite operating time delay	0.000...1800.000s	0.005s	0.04s	Delay setting
Release time delays	0.000...1800.000s	0.005s	0.06s	Pick-up release delay

Comparator modes

When setting the comparators, the user must first choose a comparator mode.

Table. 4.4.12 - 108. Comparator modes

Mode	Description
Over >	Greater than. If the measured signal is greater than the set pick-up level, the comparison condition is fulfilled.
Over (abs) >	Greater than (absolute). If the absolute value of the measured signal is greater than the set pick-up level, the comparison condition is fulfilled.
Under <	Less than. If the measured signal is less than the set pick-up level, the comparison condition is fulfilled. The user can also set a blocking limit: the comparison is not active when the measured value is less than the set blocking limit.
Under (abs) <	Less than (absolute). If the absolute value of the measured signal is less than the set pick-up level, the comparison condition is fulfilled. The user can also set a blocking limit: the comparison is not active when the measured value is less than the set blocking limit.
Delta set (%) +/- >	Relative change over time. If the measured signal changes more than the set relative pick-up value in 20 ms, the comparison condition is fulfilled. The condition is dependent on direction.
Delta abs (%) >	Relative change over time (absolute). If the measured signal changes more than the set relative pick-up value in 20 ms in either direction, the comparison condition is fulfilled. The condition is not dependent on direction.
Delta +/- measval	Change over time. If the measured signal changes more than the set pick-up value in 20 ms, the comparison condition is fulfilled. The condition is dependent on direction.
Delta abs measval	Change over time (absolute). If the measured signal changes more than the set pick-up value in 20 ms in either direction, the comparison condition is fulfilled. The condition is not dependent on direction.

The pick-up level is set individually for each comparison. When setting up the pick-up level, the user needs to take into account the modes in use as well as the desired action. The pick-up limit can be set either as positive or as negative. Each pick-up level has a separate hysteresis setting which is 3 % by default.

The user can set the operating and releasing time delays for each stage.

Function blocking

The block signal is checked in the beginning of each program cycle. The blocking signal is received from the blocking matrix in the function's dedicated input. If the blocking signal is not activated when the pick-up element activates, a START signal is generated and the function proceeds to the time characteristics calculation.

If the blocking signal is active when the pick-up element activates, a BLOCKED signal is generated and the function does not process the situation further. If the START function has been activated before the blocking signal, it resets and the release time characteristics are processed similarly to when the pick-up signal is reset.

The variables the user can set are binary signals from the system. The blocking signal needs to reach the device minimum of 5 ms before the set operating delay has passed in order for the blocking to activate in time.

Events and registers

The programmable stage function (abbreviated "PSx" in event block names) generates events and registers from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

The function's outputs can be used for direct I/O controlling and user logic programming. The function also provides a resettable cumulative counter for the START, TRIP and BLOCKED events.

Table. 4.4.12 - 109. Event messages.

Event block name	Event names
PSx	PS1...10 >/< Start ON
PSx	PS1...10 >/< Start OFF
PSx	PS1...10 >/< Trip ON
PSx	PS1...10 >/< Trip OFF
PSx	PS1...10 >/< Block ON
PSx	PS1...10 >/< Block OFF

The function registers its operation into the last twelve (12) time-stamped registers. The register of the function records the ON event process data for START, TRIP or BLOCKED. The table below presents the structure of the function's register content.

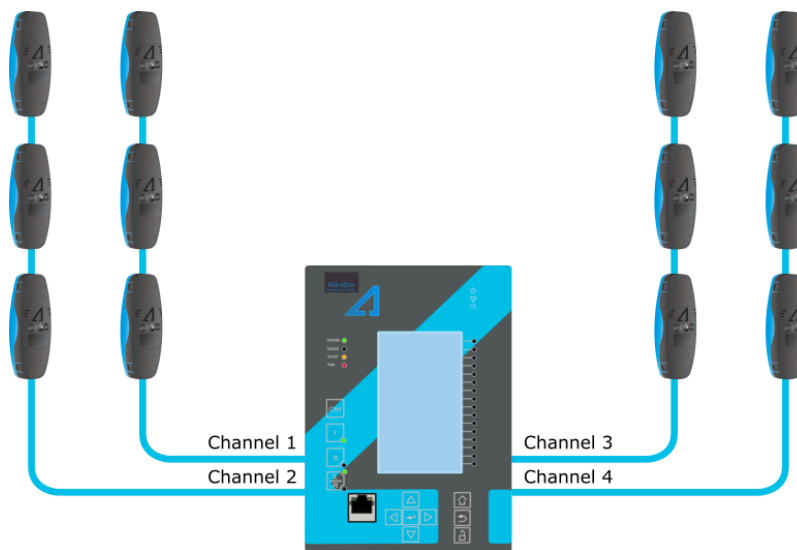

Table. 4.4.12 - 110. Register content.

Register	Description
Date and time	dd.mm.yyyy hh:mm:ss.mss
Event	Event name
>/< Mag#	The numerical value of the magnitude
Mag#/Set#	Ratio between the measured magnitude and the pick-up setting
Trip time remaining	0 ms...1800s
Setting group in use	Setting group 1...8 active

4.4.13 Arc fault protection (IArc>/IOArc>; 50Arc/50NArc)

Arc faults occur for a multitude of reasons: e.g. insulation failure, incorrect operation of the protected device, corrosion, overvoltage, dirt, moisture, incorrect wiring, or even because of aging caused by electric load. It is important to detect the arc as fast as possible in order to minimize its effects. Using arc sensors to detect arc faults is much faster than merely measuring currents and voltages. In busbar protection devices with normal protection can be too slow to disconnect arcs within a safe time frame. For example, it may be necessary to delay operation time for hundreds of milliseconds when setting up an overcurrent protection relay to control the feeder breakers to achieve selectivity. This delay can be avoided by using arc protection. The arc protection card has a high-speed output to trip signals faster as well as to extend the speed of arc protection.

Figure. 4.4.13 - 129. Protection device equipped with arc protection.

The arc protection card has four (4) sensor channels, and up to three (3) arc point sensors can be connected to each channel. The sensor channels support Arcteq AQ-01 (light sensing) and AQ-02 (pressure and light sensing) units. Optionally, the protection function can also be applied with a phase current or a residual current condition: the function trips only if the light and overcurrent conditions are met.

Table. 4.4.13 - 111. Output signals of the I/Arc>/I0Arc> function.

Outputs	Activation condition
Channel 1 Light In Channel 2 Light In Channel 3 Light In Channel 4 Light In	The arc protection card's sensor channel detects light.
Channel 1 Pressure In Channel 2 Pressure In Channel 3 Pressure In Channel 4 Pressure In	The arc protection card's sensor channel detects pressure.
ARC Binary input signal	The arc protection card's binary input is energized.
I/I0 Arc> Ph. curr. START I/I0 Arc> Res. curr. START	The measured phase current or the residual current is over the set limit.
I/I0 Arc> Ph. curr. BLOCKED I/I0 Arc> Res. curr. BLOCKED	The phase current or the residual current measurement is blocked by an input.
I/I0 Arc> Zone 1 TRIP I/I0 Arc> Zone 2 TRIP I/I0 Arc> Zone 3 TRIP I/I0 Arc> Zone 4 TRIP	All required conditions for tripping the zone are met (light OR light and current).

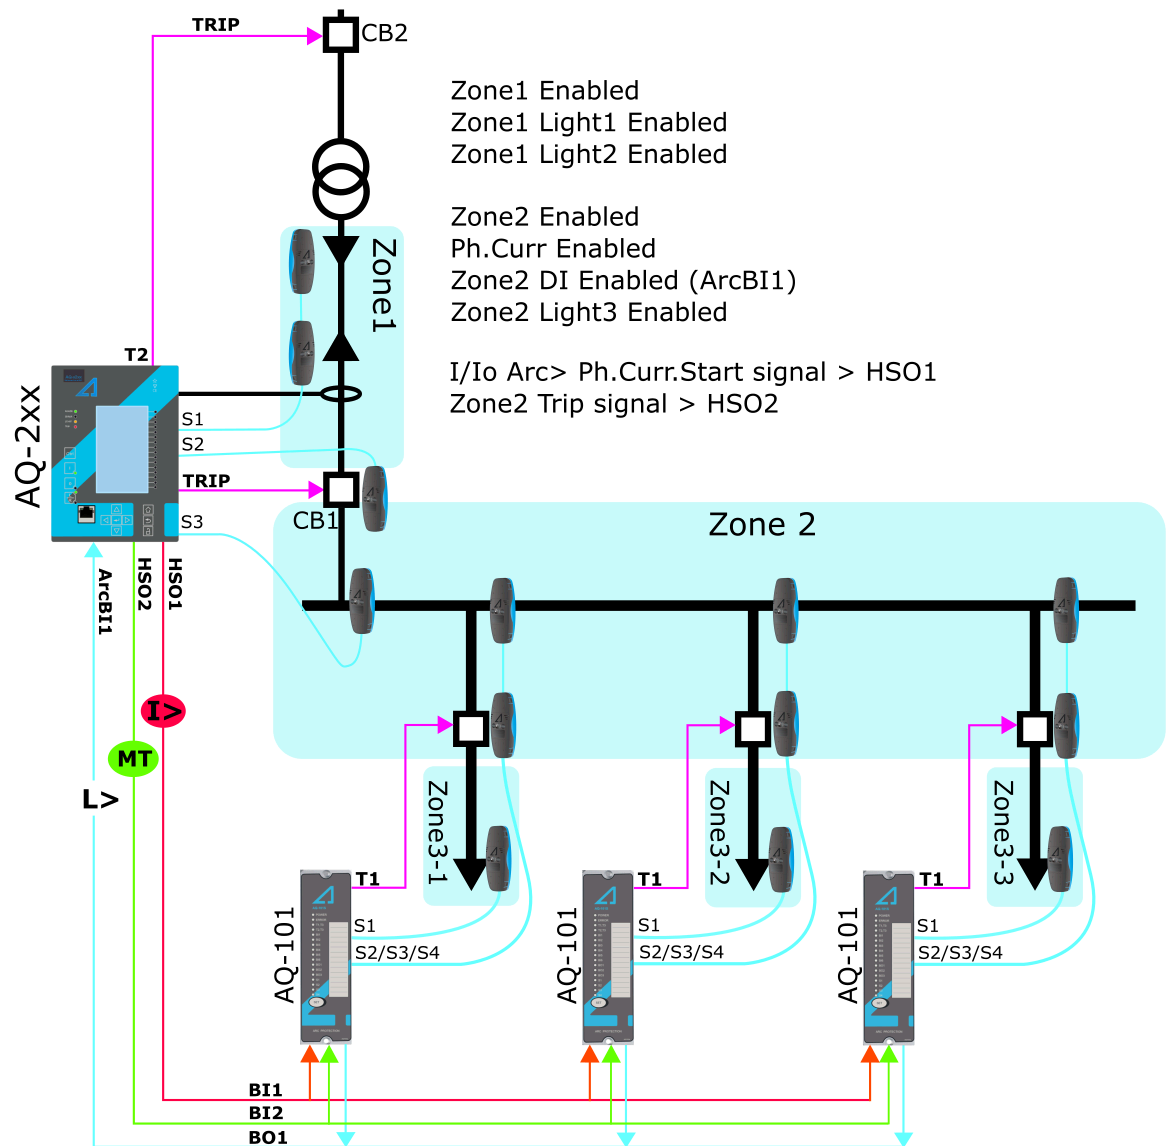

Outputs	Activation condition
I/I0 Arc> Zone 1 BLOCKED I/I0 Arc> Zone 2 BLOCKED I/I0 Arc> Zone 3 BLOCKED I/I0 Arc> Zone 4 BLOCKED	All required conditions for tripping the zone are met (light OR light and current) but the tripping is blocked by an input.
I/I0 Arc> S1 Sensor fault I/I0 Arc> S2 Sensor fault I/I0 Arc> S3 Sensor fault I/I0 Arc> S4 Sensor fault	The detected number of sensors in the channel does not match the settings.
I/I0 Arc> IO unit fault	The number of connected AQ-100 series units does not match the number of units set in the settings.

Example of scheme setting

The following examples helps the user better understand how the arc protection function is set. In the examples AQ-101 models are used to extend the protection of Zone 2 and to protect each outgoing feeder (Zone 3).

This scheme is a single-line diagram with AQ-200 series devices and with AQ-101 arc protection relays. The settings are for an incoming feeder AQ-200 device.

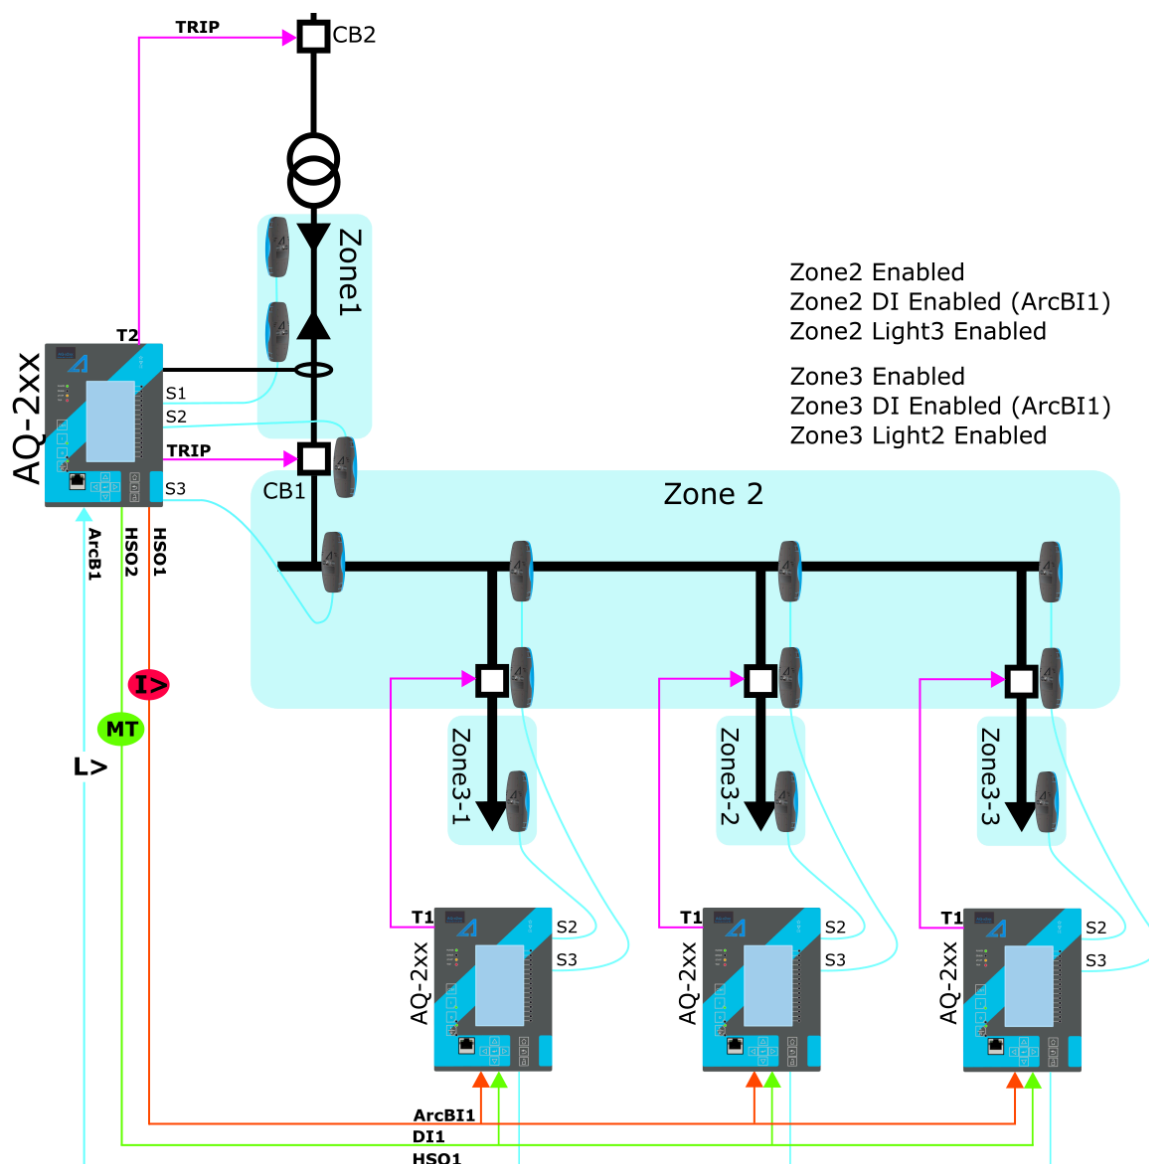

Figure. 4.4.13 - 130. Scheme with AQ-101 arc protection relays.

To set the zones for the AQ-200 models sensor channels start by enabling the protected zones (in this case, Zones 1 and 2). Then define which sensor channels are sensing which zones (in this case, sensor channels S1 and S2 are protecting Zone 1). Enable Light 1 of Zone 1 as well as Light 2 of Zone 2. The sensor channel S3 deals with Zone 2. Enable Light 3 of Zone 2. The high-speed output contacts HSO1 and HSO2 have been set to send overcurrent and master trip signals to the AQ-101 arc protection relays. The AQ-100 series units send out test pulses in specific intervals to check the health of the wiring between the AQ-100 series units. The parameter *I/Io Arc> Self supervision test pulse* should be activated when connecting the AQ-100 series units to the AQ-200 series arc protection card to prevent the pulses from activating ArcBI1.

The next example is almost like the previous one: it is also a single-line diagram with AQ 200 series devices. However, this time each outgoing feeder has an AQ-200 protection device instead of an AQ-101 arc protection relay.

Figure. 4.4.13 - 131. Scheme with AQ-200 protection devices.

The settings for the device supervising the incoming feeder are the same as in the first example. The devices supervising the busbar and the outgoing feeder, however, have a different setting. Both Zones 2 and 3 need to be enabled as there are sensors connected to both Zone 2 and 3 starts. Sensors connected to the channel S3 are in Zone 2. Then enable Light 3 of Zone 2. The sensor connected to the channel S2 is in Zone 3. Then enable Light 2 of Zone 3.

If any of the channels have a pressure sensing sensor, enable it the same way as the regular light sensors. If either phase overcurrent or residual overcurrent is needed for the tripping decision, they can be enabled in the same way as light sensors in the zone. When a current channel is enabled, the measured current needs to be above the set current limit in addition to light sensing.

Measured input

Arc protection uses samples based on current measurements. If the required number of samples is found to be above the setting limit, the current condition activates. The arc protection can use either phase currents, residual currents or both.

Table. 4.4.13 - 112. Measurement inputs of the U1/U2>/< function.

Signal	Description	Time base
I _{L1} samples	Samples received by I _{L1} current measurement channel	5ms
I _{L2} samples	Samples received by I _{L2} current measurement channel	5ms
I _{L3} samples	Samples received by I _{L3} current measurement channel	5ms
I ₀₁ samples	Samples received by I ₀₁ current measurement channel	5ms
I ₀₂ samples	Samples received by I ₀₂ current measurement channel	5ms

General settings

The following general settings define the general behavior of the function. These settings are static i.e. it is not possible to change them by editing the setting group.

Table. 4.4.13 - 113. General settings of the function.

Name	Range	Default	Description
I/O Arc> force status to	<ul style="list-style-type: none"> Normal PH curr blocked PH curr Start ResCurr Blocked ResCurr Start Zone 1 Trip Zone1 Blocked Zone2 Trip Zone2 Blocked Zone3 Trip Zone3 Blocked Zone4 Trip Zone4 Blocked 	Normal	Force the status of the function. Visible only when <i>Enable stage forcing</i> parameter is enabled in <i>General</i> menu.
Channel 1 sensors	<ul style="list-style-type: none"> No sensors 1 sensor 2 sensors 3 sensors 	No sensors	Defines the number of sensors connected to the channel (channels 1/2/3/4).
Channel 2 sensors

Channel 4 sensors			

Name	Range	Default	Description
Channel 1 sensor status	<ul style="list-style-type: none"> Sensors OK Configuration fault state 	-	Displays the status of the sensor channel. If the number of sensors connected to the channel does not match with the set "Channel 1/2/3/4 sensors" setting, this parameter will go to the "Configuration fault" state.
Channel 2 sensor status			
Channel 3 sensor status			
Channel 4 sensor status			

Pick-up settings

The pick-up of each zone of the $I_{arc} > I_{0arc}$ function is controlled by one of the following: the phase current pick-up setting, the residual current pick-up setting, or the sensor channels. The pick-up setting depends on which of these are activated in the zone.

Setting group selection controls the operating characteristics of the function, i.e. the user or user-defined logic can change function parameters while the function is running.

Table. 4.4.13 - 114. Enabled Zone pick-up settings.

Name	Range	Step	Default	Description
Phase current pick-up	0.05...40.00 $\times I_n$	0.01 $\times I_n$	1.2 $\times I_n$	The phase current measurement's pick-up value (in p.u.).
I0 input selection	<ul style="list-style-type: none"> None I01 I02 	-	None	Selects the residual current channel (I01 or I02).
Res.current pick-up	0.05...40.00 $\times I_{0n}$	0.01 $\times I_{0n}$	1.2 $\times I_{0n}$	The residual current measurement's pick-up value (in p.u.).
Zone1/2/3/4 Enabled	<ul style="list-style-type: none"> Disabled Enabled 	-	Disabled	Enables the chosen zone. Up to 4 zones can be enabled.
Zone1/2/3/4 Ph. curr. Enabled	<ul style="list-style-type: none"> Disabled Enabled 	-	Disabled	The phase overcurrent allows the zone to trip when light is detected.

Name	Range	Step	Default	Description
Zone1/2/ 3/4 Light 1 Enabled	<ul style="list-style-type: none"> Disabled Enabled 	-	Disabled	Light detected in sensor channel 1 trips the zone.
Zone1/2/ 3/4 Light 2 Enabled	<ul style="list-style-type: none"> Disabled Enabled 	-	Disabled	Light detected in sensor channel 2 trips the zone.
Zone1/2/ 3/4 Light 3 Enabled	<ul style="list-style-type: none"> Disabled Enabled 	-	Disabled	Light detected in sensor channel 3 trips the zone.
Zone1/2/ 3/4 Light 4 Enabled	<ul style="list-style-type: none"> Disabled Enabled 	-	Disabled	Light detected in sensor channel 4 trips the zone.
Zone1/2/ 3/4 Pres. 1 Enabled	<ul style="list-style-type: none"> Disabled Enabled 	-	Disabled	Pressure detected in sensor channel 1 trips the zone.
Zone1/2/ 3/4 Pres. 2 Enabled	<ul style="list-style-type: none"> Disabled Enabled 	-	Disabled	Pressure detected in sensor channel 2 trips the zone.
Zone1/2/ 3/4 Pres. 3 Enabled	<ul style="list-style-type: none"> Disabled Enabled 	-	Disabled	Pressure detected in sensor channel 3 trips the zone.
Zone1/2/ 3/4 Pres. 4 Enabled	<ul style="list-style-type: none"> Disabled Enabled 	-	Disabled	Pressure detected in sensor channel 4 trips the zone.
Zone1/2/ 3/4 DI Enabled	<ul style="list-style-type: none"> Disabled Light In Current In 	-	Disabled	Arc protection option card digital input function selection. "Light In" mode trips the zone when digital input is active. In "Current In" mode digital input must be active at the same time as any of the sensor channels for the zone to trip.

Read-only parameters

The function's *Info* page displays useful, real-time information on the state of the protection function. It is accessed either through the device's HMI display, or through the setting tool software when it is connected to the device and its Live Edit mode is active.

Table. 4.4.13 - 115. Information displayed by the function.

Name	Range	Description
I/O Arc> condition	<ul style="list-style-type: none"> Z1 Trip Z1 Blocked Z2 Trip Z2 Blocked Z3 Trip Z3 Blocked Z4 Trip Z4 Blocked 	Displays status of the protection function.

---------------	---	---

Function blocking

The block signal is checked in the beginning of each program cycle. The blocking signal is received from the blocking matrix in the function's dedicated input. If the blocking signal is not activated when the pick-up element activates, a TRIP signal is generated.

If the blocking signal is active when the pick-up element activates, a BLOCKED signal is generated and the function does not process the situation further.

The variables the user can set are binary signals from the system. The blocking signal needs to reach the device minimum of 5 ms before the set operating delay has passed in order for the blocking to activate in time.

Events and registers

The arc fault protection function (abbreviated "ARC" in event block names) generates events and registers from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

The function's outputs can be used for direct I/O controlling and user logic programming. The function also provides a resettable cumulative counter for the events.

Table. 4.4.13 - 116. Event messages.

Event block name	Event names
ARC1	Zone 1...4 Trip ON
ARC1	Zone 1...4 Trip OFF
ARC1	Zone 1...4 Block ON
ARC1	Zone 1...4 Block OFF
ARC1	Phase current Blocked ON
ARC1	Phase current Blocked OFF
ARC1	Phase current Start ON

Event block name	Event names
ARC1	Phase current Start OFF
ARC1	Residual current Blocked ON
ARC1	Residual current Blocked OFF
ARC1	Residual current Start ON
ARC1	Residual current Start OFF
ARC1	Channel 1...4 Light ON

ARC1	I/O Arc> Sensor 1...4 Fault OFF
ARC1	I/O Arc> I/O-unit Fault ON
ARC1	I/O Arc> I/O-unit Fault OFF

The function registers its operation into the last twelve (12) time-stamped registers. The table below presents the structure of the function's register content.

Table. 4.4.13 - 117. Register content.

Register	Description
Date and time	dd.mm.yyyy hh:mm:ss.mss
Event	Event name
Phase A current	Trip current
Phase B current	
Phase C current	
Residual current	
Active sensors	1...4
Setting group in use	Setting group 1...8 active

4.5 Control functions

4.5.1 Common signals

Common signals function has all protection function start and trip signals internally connected to Common START and TRIP output signals. When any of the activated protection functions generate a START or a TRIP signal, Common signals function will also generate the same signal.

General settings

The following general settings define the general behavior of the function. These settings are static i.e. it is not possible to change them by editing the setting group.

Table. 4.5.1 - 118. General settings of the function.

Name	Range	Default	Description
Common force status to	<ul style="list-style-type: none"> Normal Start Trip 	Normal	Force the status of the function. Visible only when <i>Enable stage forcing</i> parameter is enabled in <i>General</i> menu.

Common signals function has all START and TRIP signals of protection functions internally connected to Common START and TRIP output signals. But it is also possible to assign extra signals to activate Common START and TRIP.

Table. 4.5.1 - 119. Common signals extra inputs.

Name	Description
Common Start In	Assign extra signals to activate common START signal. Please note that all protection function START signals are already assigned internally to Common START.
Common Trip In	Assign extra signals to activate common TRIP signal. Please note that all protection function TRIP signals are already assigned internally to Common TRIP.

Read-only parameters

The function's *Info* page displays useful, real-time information on the state of the protection function. It is accessed either through the device's HMI display, or through the setting tool software when it is connected to the device and its Live Edit mode is active.

Table. 4.5.1 - 120. Information displayed by the function.

Name	Range	Description
Common signals condition	<ul style="list-style-type: none"> Normal Start Trip 	Displays status of the function.

Function blocking

Common signals function itself doesn't have blocking input signals. Blocking of tripping should be done in each protection function settings.

Events

The common signals function (abbreviated "GNSIG" in event block names) generates events from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both.

The function's outputs can be used for direct I/O controlling and user logic programming. The function also provides a resettable cumulative counter for the START and TRIP events.

The events triggered by the function are recorded with a time stamp.

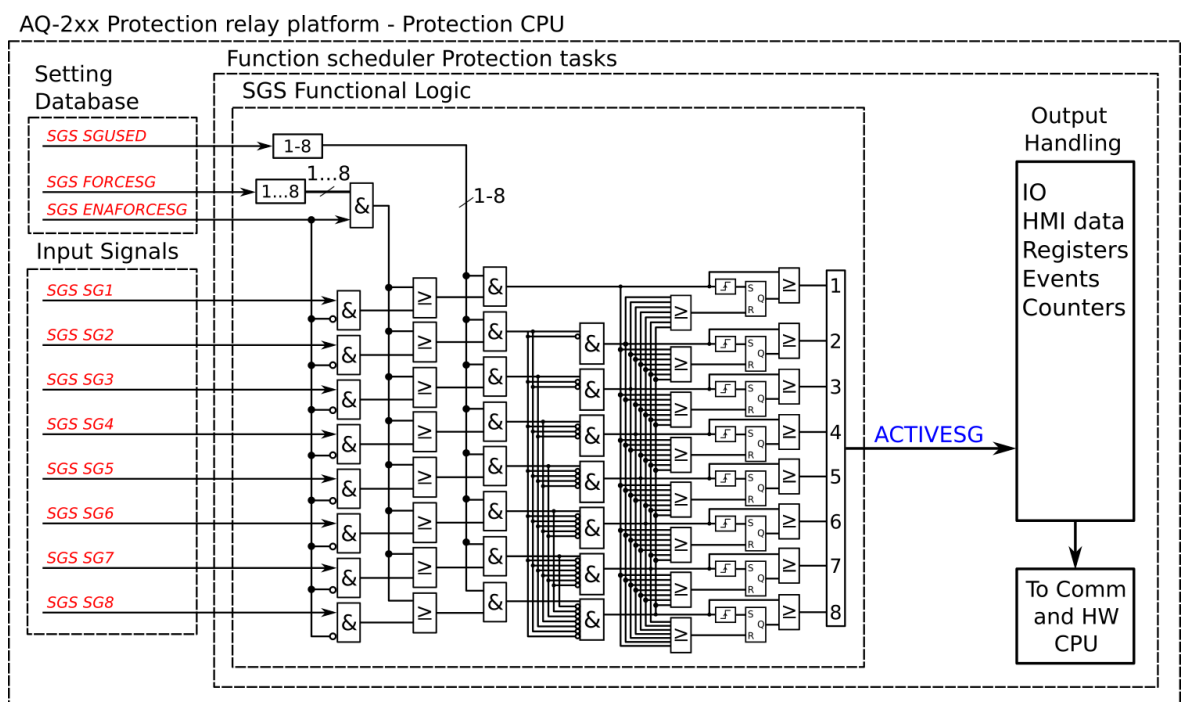

Table. 4.5.1 - 121. Event messages.

Event block name	Event names
GNSIG	Common Start ON
GNSIG	Common Start OFF
GNSIG	Common Trip ON
GNSIG	Common Trip OFF

4.5.2 Setting group selection

All device types support up to eight (8) separate setting groups. The Setting group selection function block controls the availability and selection of the setting groups. By default, only Setting group 1 (SG1) is active and therefore the selection logic is idle. When more than one setting group is enabled, the setting group selector logic takes control of the setting group activations based on the logic and conditions the user has programmed.

Figure. 4.5.2 - 132. Simplified function block diagram of the setting group selection function.

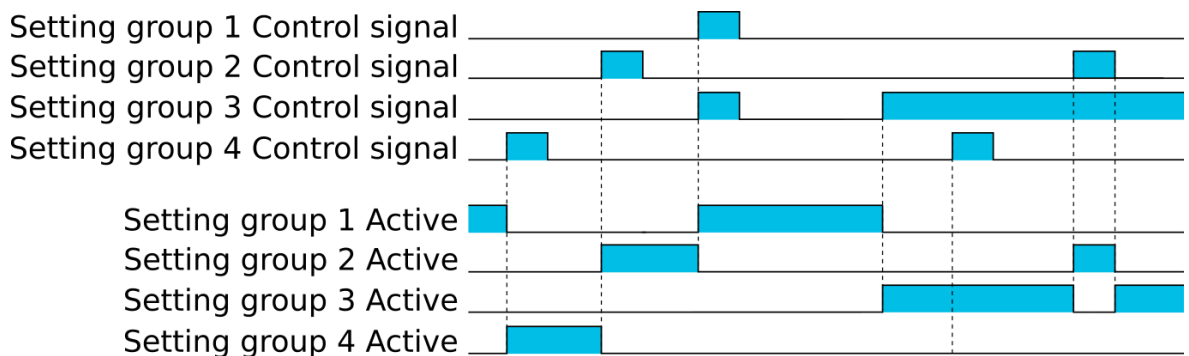

Setting group selection can be applied to each of the setting groups individually by activating one of the various internal logic inputs and connected digital inputs. The user can also force any of the setting groups on when the "Force SG change" setting is enabled by giving the wanted quantity of setting groups as a number in the communication bus or in the local HMI, or by selecting the wanted setting group from *Control* → *Setting groups*. When the forcing parameter is enabled, the automatic control of the local device is overridden and the full control of the setting groups is given to the user until the "Force SG change" is disabled again.

Setting groups can be controlled either by pulses or by signal levels. The setting group controller block gives setting groups priority values for situations when more than one setting group is controlled at the same time: the request from a higher-priority setting group is taken into use.

Setting groups follow a hierarchy in which setting group 1 has the highest priority, setting group 2 has second highest priority etc. If a static activation signal is given for two setting groups, the setting group with higher priority will be active. If setting groups are controlled by pulses, the setting group activated by pulse will stay active until another setting groups receives an activation signal.

Figure. 4.5.2 - 133. Example sequences of group changing (control with pulse only, or with both pulses and static signals).

Settings and signals

The settings of the setting group control function include the active setting group selection, the forced setting group selection, the enabling (or disabling) of the forced change, the selection of the number of active setting groups in the application, as well as the selection of the setting group changed remotely. If the setting group is forced to change, the corresponding setting group must be enabled and the force change must be enabled. Then, the setting group can be set from communications or from HMI to any available group. If the setting group control is applied with static signals right after the "Force SG" parameter is released, the application takes control of the setting group selection.

Table. 4.5.2 - 122. Settings of the setting group selection function.

Name	Range	Default	Description
Active setting group	<ul style="list-style-type: none"> • SG1 • SG2 • SG3 • SG4 • SG5 • SG6 • SG7 • SG8 	SG1	Displays which setting group is active.

Name	Range	Default	Description
Force setting group	<ul style="list-style-type: none"> None SG1 SG2 SG3 SG4 SG5 SG6 SG7 SG8 	None	The selection of the overriding setting group. After "Force SG change" is enabled, any of the configured setting groups in the device can be overridden. This control is always based on the pulse operating mode. It also requires that the selected setting group is specifically controlled to ON after "Force SG" is disabled. If there are no other controls, the last set setting group remains active.
Force setting group change	<ul style="list-style-type: none"> Disabled Enabled 	Disabled	The selection of whether the setting group forcing is enabled or disabled. This setting has to be active before the setting group can be changed remotely or from a local HMI. This parameter overrides the local control of the setting groups and it remains on until the user disables it.
Used setting groups	<ul style="list-style-type: none"> SG1 SG1...2 SG1...3 SG1...4 SG1...5 SG1...6 SG1...7 SG1...8 	SG1	The selection of the activated setting groups in the application. Newly-enabled setting groups use default parameter values.
Remote setting group change	<ul style="list-style-type: none"> None SG1 SG2 SG3 SG4 SG5 SG6 SG7 SG8 	None	This parameter can be controlled through SCADA to change the setting group remotely. Please note that if a higher priority setting group is being controlled by a signal, a lower priority setting group cannot be activated with this parameter.

Table. 4.5.2 - 123. Signals of the setting group selection function.

Name	Description
Setting group 1	The selection of Setting group 1 ("SG1"). Has the highest priority input in setting group control. Can be controlled with pulses or static signals. If static signal control is applied, no other SG requests will be processed.
Setting group 2	The selection of Setting group 2 ("SG2"). Has the second highest priority input in setting group control. Can be controlled with pulses or static signals. If static signal control is applied, no requests with a lower priority than SG1 will be processed.
Setting group 3	The selection of Setting group 3 ("SG3"). Has the third highest priority input in setting group control. Can be controlled with pulses or static signals. If static signal control is applied, no requests with a lower priority than SG1 and SG2 will be processed.
Setting group 4	The selection of Setting group 4 ("SG4"). Has the fourth highest priority input in setting group control. Can be controlled with pulses or static signals. If static signal control is applied, no requests with a lower priority than SG1, SG2 and SG3 will be processed.
Setting group 5	The selection of Setting group 5 ("SG5"). Has the fourth lowest priority input in setting group control. Can be controlled with pulses or static signals. If static signal control is applied, SG6, SG7 and SG8 requests will not be processed.

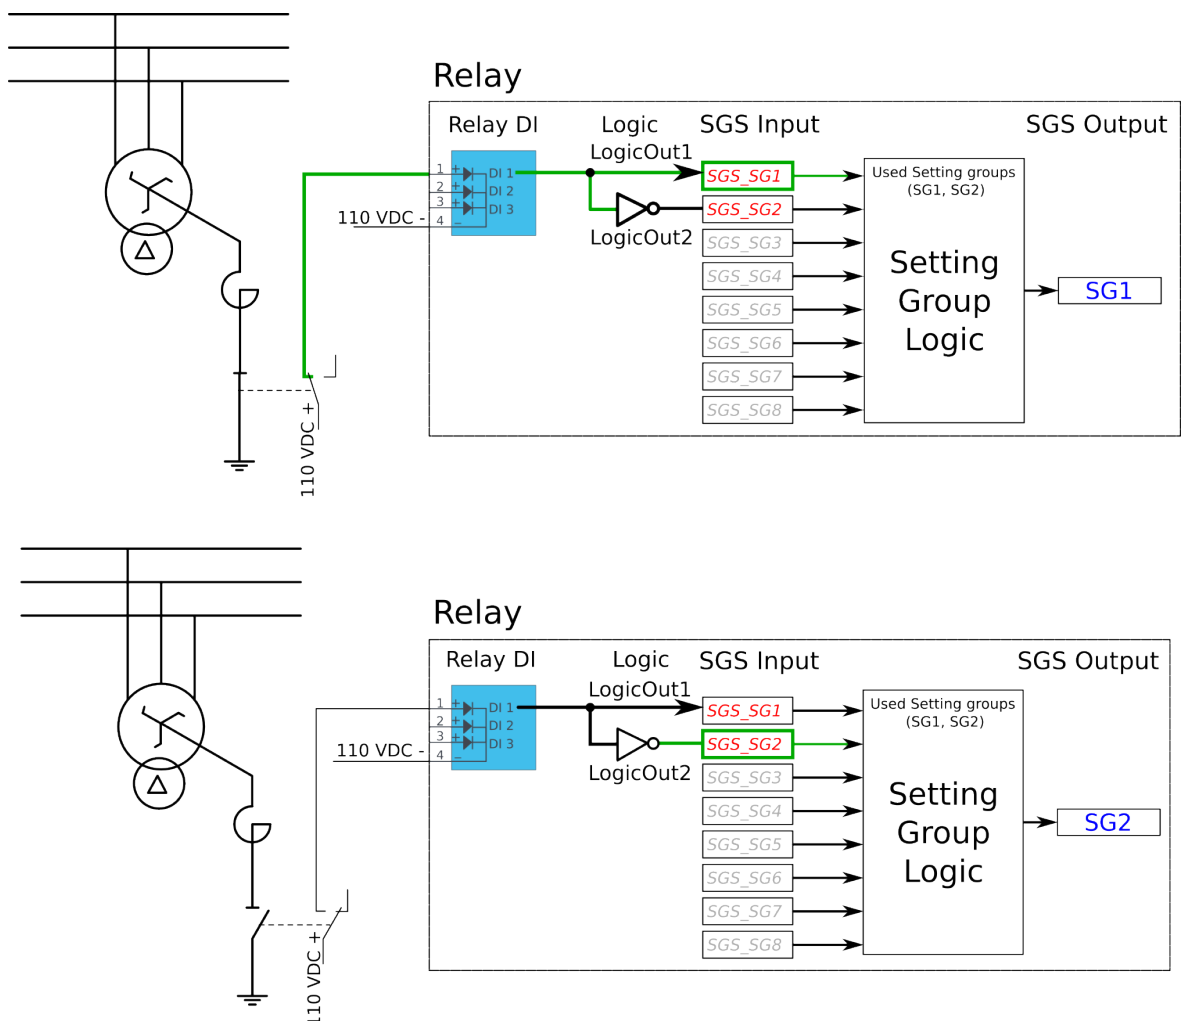

Name	Description
Setting group 6	The selection of Setting group 6 ("SG6"). Has the third lowest priority input in setting group control. Can be controlled with pulses or static signals. If static signal control is applied, SG7 and SG8 requests will not be processed.
Setting group 7	The selection of Setting group 7 ("SG7"). Has the second lowest priority input in setting group control. Can be controlled with pulses or static signals. If static signal control is applied, only SG8 requests will not be processed.
Setting group 8	The selection of Setting group 8 ("SG8"). Has the lowest priority input in setting group control. Can be controlled with pulses or static signals. If static signal control is applied, all other SG requests will be processed regardless of the signal status of this setting group.

Example applications for setting group control

This chapter presents some of the most common applications for setting group changing requirements.

A Petersen coil compensated network usually uses directional sensitive earth fault protection. The user needs to control its characteristics between varmetric and wattmetric; the selection is based on whether the Petersen coil is connected when the network is compensated, or whether it is open when the network is unearthed.

Figure. 4.5.2 - 134. Setting group control – one-wire connection from Petersen coil status.

Depending on the application's requirements, the setting group control can be applied either with a one-wire connection or with a two-wire connection by monitoring the state of the Petersen coil connection.

When the connection is done with one wire, the setting group change logic can be applied as shown in the figure above. The status of the Petersen coil controls whether Setting group 1 is active. If the coil is disconnected, Setting group 2 is active. This way, if the wire is broken for some reason, the setting group is always controlled to SG2.

Figure. 4.5.2 - 135. Setting group control – two-wire connection from Petersen coil status.

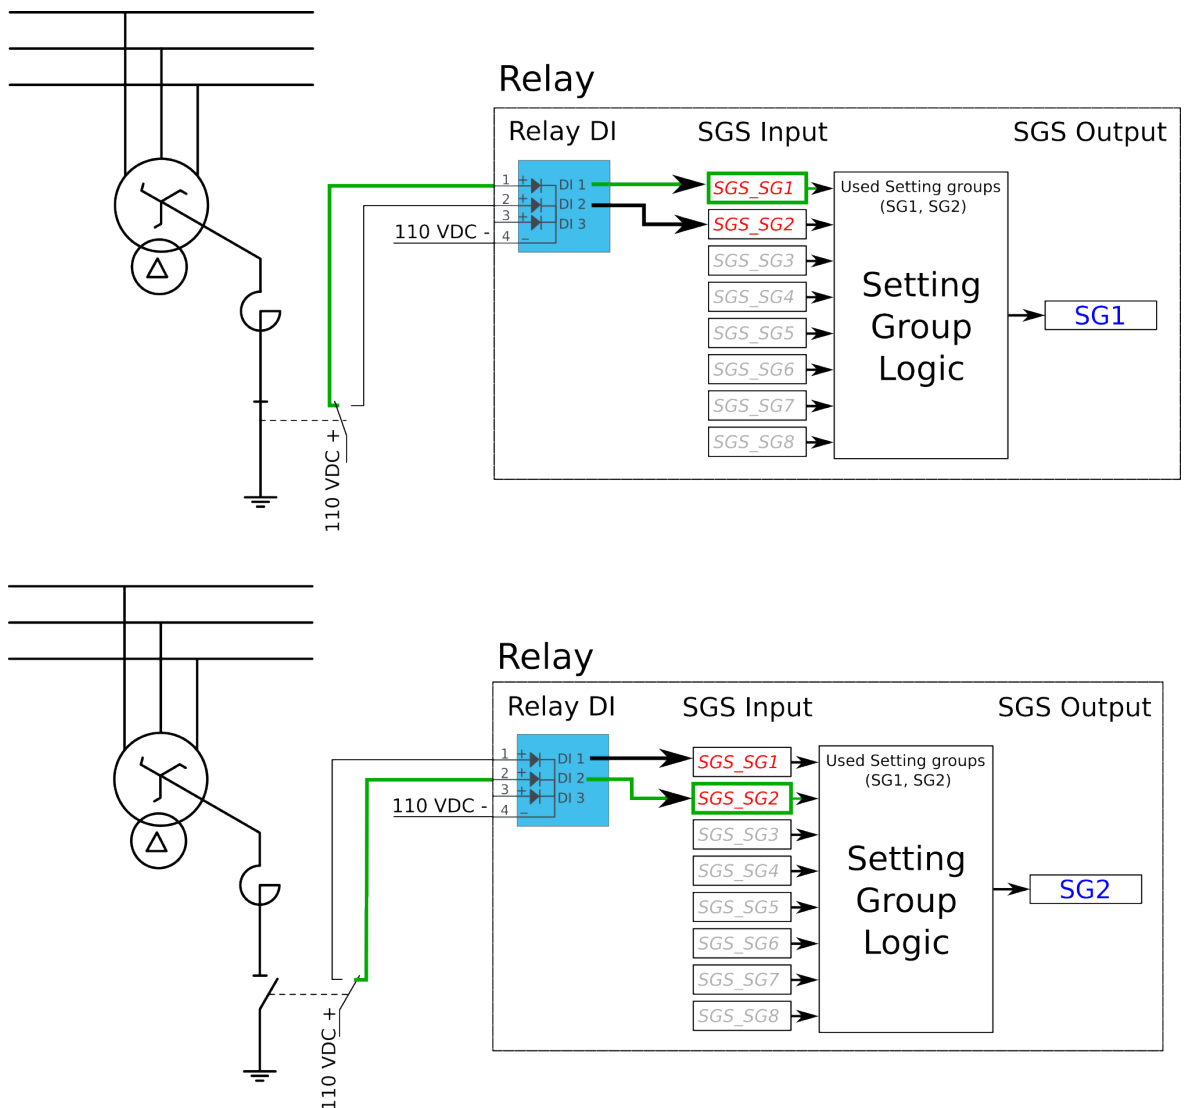

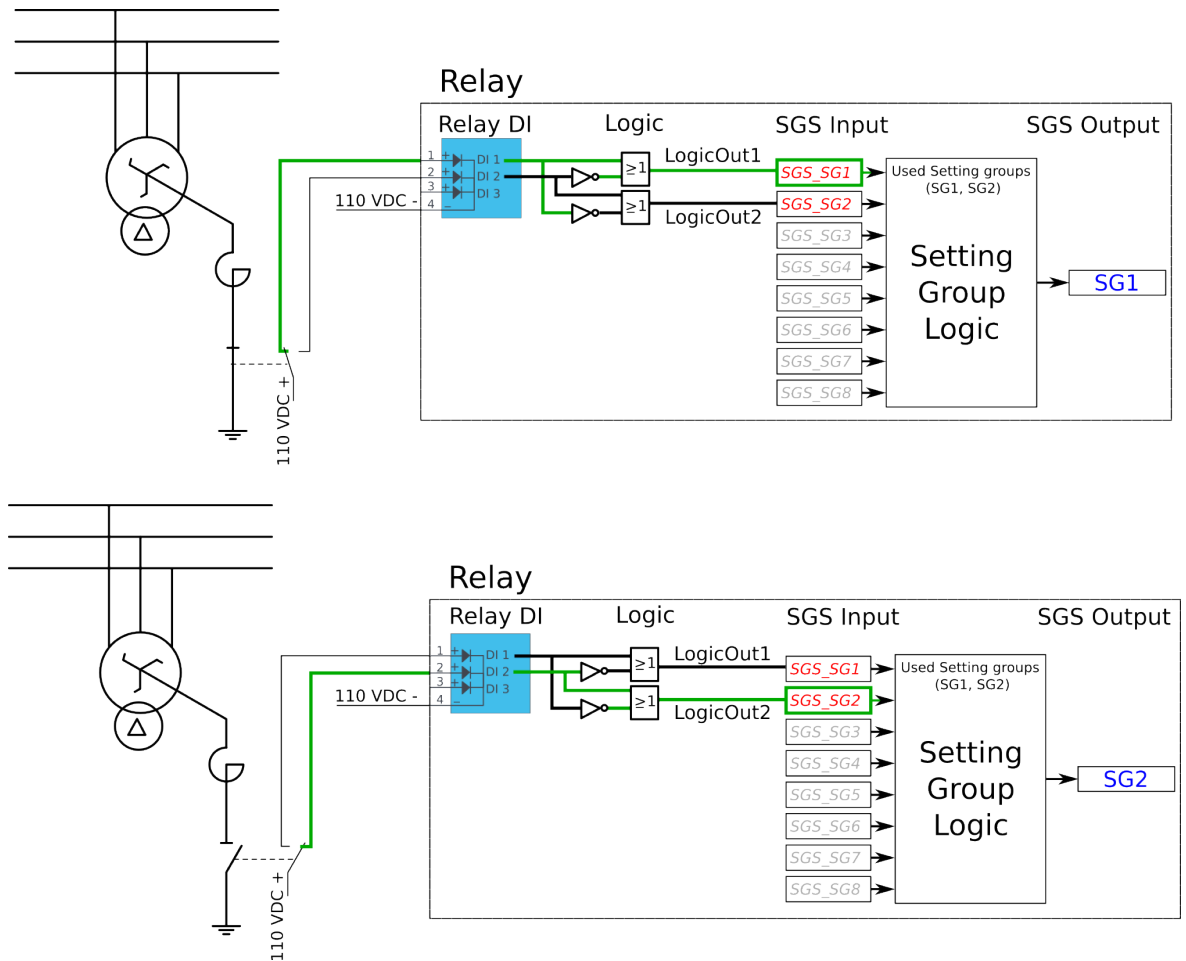

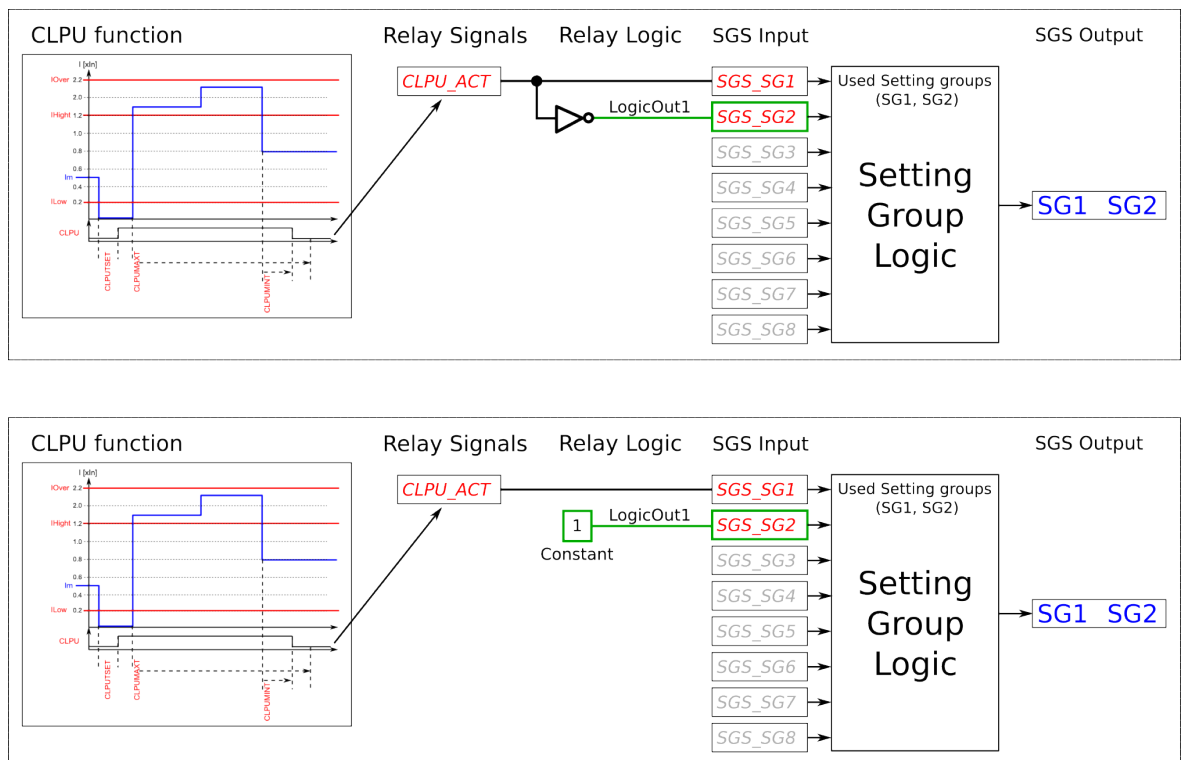

Figure. 4.5.2 - 136. Setting group control – two-wire connection from Petersen coil status with additional logic.

The images above depict a two-wire connection from the Petersen coil: the two images at the top show a direct connection, while the two images on the bottom include additional logic. With a two-wire connection the state of the Petersen coil can be monitored more securely. The additional logic ensures that a single wire loss will not affect the correct setting group selection.

The application-controlled setting group change can also be applied entirely from the device's internal logics. For example, the setting group change can be based on the cold load pick-up function (see the image below).

Figure. 4.5.2 - 137. Entirely application-controlled setting group change with the cold load pick-up function.

In these examples the cold load pick-up function's output is used for the automatic setting group change. Similarly to this application, any combination of the signals available in the device's database can be programmed to be used in the setting group selection logic.

As all these examples show, setting group selection with application control has to be built fully before they can be used for setting group control. The setting group does not change back to SG1 unless it is controlled back to SG1 by this application; this explains the inverted signal NOT as well as the use of logics in setting group control. One could also have SG2 be the primary SG, while the ON signal would be controlled by the higher priority SG1; this way the setting group would automatically return to SG2 after the automatic control is over.

Events

The setting group selection function block (abbreviated "SGS" in event block names) generates events from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

Table. 4.5.2 - 124. Event messages.

Event block name	Event names
SGS	SG2...8 Enabled
SGS	SG2...8 Disabled
SGS	SG1...8 Request ON
SGS	SG1...8 Request OFF
SGS	Remote Change SG Request ON

Event block name	Event names
SGS	Remote Change SG Request OFF
SGS	Local Change SG Request ON
SGS	Local Change SG Request OFF
SGS	Force Change SG ON
SGS	Force Change SG OFF
SGS	SG Request Fail Not configured SG ON
SGS	SG Request Fail Not configured SG OFF
SGS	Force Request Fail Force ON
SGS	Force Request Fail Force OFF
SGS	SG Req. Fail Lower priority Request ON
SGS	SG Req. Fail Lower priority Request OFF
SGS	SG1...8 Active ON
SGS	SG1...8 Active OFF

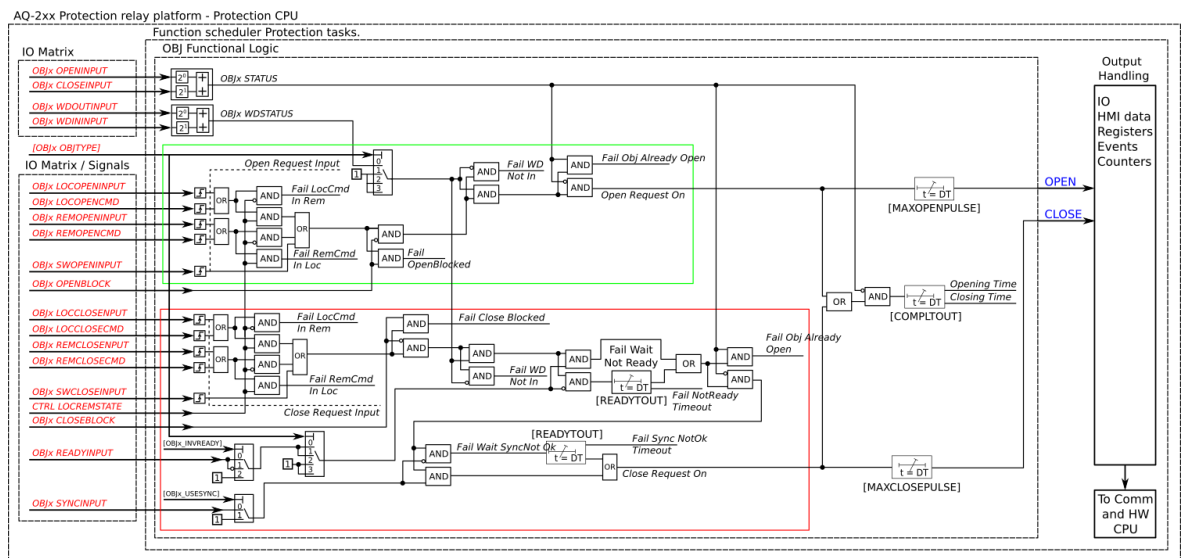

4.5.3 Object control and monitoring

The object control and monitoring function takes care of both for circuit breakers and disconnectors. The monitoring and controlling are based on the statuses of the device's configured digital inputs and outputs. The number of controllable and monitored objects in each device depends on the device type and amount of digital inputs. One controllable object requires a minimum of two (2) output contacts. The status monitoring of one monitored object usually requires two (2) digital inputs. Alternatively, object status monitoring can be performed with a single digital input: the input's active state and its zero state (switched to 1 with a NOT gate in the Logic editor).

An object can be controlled manually or automatically. Manual control can be done by local control, or by remote control. Local manual control can be done by devices front panel (HMI) or by external push buttons connected to devices digital inputs. Manual remote control can be done through one of the various communication protocols available (Modbus, IEC101/103/104 etc.). The function supports the modes "Direct control" and "Select before execute" while controlled remotely. Automatic controlling can be done with functions like auto-reclosing function (ANSI 79).

The main outputs of the function are the OBJECT OPEN and OBJECT CLOSE control signals. Additionally, the function reports the monitored object's status and applied operations. The setting parameters are static inputs for the function, which can only be changed by the user in the function's setup phase.

Figure. 4.5.3 - 138. Simplified function block diagram of the object control and monitoring function.

Settings

The following parameters help the user to define the object. The operation of the function varies based on these settings and the selected object type. The selected object type determines how much control is needed and which setting parameters are required to meet those needs.

Table. 4.5.3 - 125. Object settings and status parameters.

Name	Range	Default	Description
Local/Remote status	<ul style="list-style-type: none"> Local Remote 	Remote	Displays the status of the device's "local/remote" switch. Local controls cannot override the open and close commands while device is in "Remote" status. The remote controls cannot override the open and close commands while device is in "Local" status.
Object status force to	<ul style="list-style-type: none"> Normal Openreq On Closereq On Opensignal On Closesignal On WaitNoRdy On WaitNoSnc On NotrdyFail On NosyncFail On Opentout On Clotout On OpenreqUSR On CloreqUSR On 	Normal	Force the status of the function. Visible only when <i>Enable stage forcing</i> parameter is enabled in <i>General</i> menu.
Object name	-	Objectx	The user-set name of the object, at maximum 32 characters long.

Name	Range	Default	Description
Object type	<ul style="list-style-type: none"> • Withdrawable circuit breaker • Circuit breaker • Disconnecter (MC) • Disconnecter (GND) 	Circuit breaker	The selection of the object type. This selection defines the number of required digital inputs for the monitored object. This affects the symbol displayed in the HMI and the monitoring of the circuit breaker. It also affects whether the withdrawable cart is in/out status is monitored. See the next table ("Object types") for a more detailed look at which functionalities each of the object types have.
Objectx Breaker status	<ul style="list-style-type: none"> • Intermediate • Open • Closed • Bad 	-	Displays the status of breaker. Intermediate is displayed when neither of the status signals (open or close) are active. Bad status is displayed when both status signals (open and close) are active.
Objectx Withdraw status	<ul style="list-style-type: none"> • WDIntermediate • WDCartOut • WDCart In • WDBad • Not in use 	-	Displays the status of circuit breaker cart. WDIntermediate is displayed when neither of the status signals (in or out) are active. WDBad status is displayed when both status signals (in and out) are active. If the selected object type is not set to "Withdrawable circuit breaker", this setting displays the "No in use" option.
Additional status information	<ul style="list-style-type: none"> • Open Blocked • Open Allowed • Close Blocked • Close Allowed • Object Ready • Object Not Ready • Sync Ok • Sync Not Ok 	-	Displays additional information about the status of the object.
Use Synchrocheck	<ul style="list-style-type: none"> • Not in use • Synchrocheck in use 	Not in use	Selects whether the "Synchrocheck" condition is in use for the circuit breaker close command. If "In use" is selected the input chosen to "Sync.check status in" has to be active to be able to close circuit breaker. Synchrocheck status can be either an internal signal generated by synchrocheck function or digital input activation with an external synchrocheck device.
Use Object ready	<ul style="list-style-type: none"> • Ready High • Ready Low • Not in use 	Not in use	Selects whether the "Object ready" condition is in use for the circuit breaker close command. If in use the signal connected to "Object ready status In" has to be high or low to be able to close the breaker (depending on "Ready High or Low" selection).
Open requests	$0 \dots 2^{32} - 1$	-	Displays the number of successful "Open" requests.
Close requests	$0 \dots 2^{32} - 1$	-	Displays the number of successful "Close" requests.
Open requests failed	$0 \dots 2^{32} - 1$	-	Displays the number of failed "Open" requests.
Close requests failed	$0 \dots 2^{32} - 1$	-	Displays the number of failed "Close" requests.
Clear statistics	<ul style="list-style-type: none"> • - • Clear 	-	Clears the request statistics, setting them back to zero (0). Automatically returns to "-" after the clearing is finished.

Table. 4.5.3 - 126. Object types.

Name	Functionalities	Description
Withdrawable circuit breaker	Breaker cart position Circuit breaker position Circuit breaker control Object ready check before closing breaker Synchrochecking before closing breaker Interlocks	The monitor and control configuration of the withdrawable circuit breaker.
Circuit breaker	Position indication Control Object ready check before closing breaker Synchrochecking before closing breaker Interlocks	The monitor and control configuration of the circuit breaker.
Disconnecter (MC)	Position indication Control	The position monitoring and control of the disconnector.
Disconnecter (GND)	Position indication	The position indication of the earth switch.

Table. 4.5.3 - 127. I/O.

Signal	Range	Description
Objectx Open input ("Objectx Open Status In")	Digital input or other logical signal selected by the user (SWx)	A link to a physical digital input. The monitored object's OPEN status. "1" refers to the active open state of the monitored object.
Objectx Close input ("Objectx Close Status In")		A link to a physical digital input. The monitored object's CLOSE status. "1" refers to the active close state of the monitored object.
WD Object In ("Withdrw.CartIn.Status In")		A link to a physical digital input. The monitored withdrawable object's position is IN. "1" means that the withdrawable object cart is in.
WD Object Out ("Withdrw.CartOut.Status In")		A link to a physical digital input. The monitored withdrawable object's position is OUT. "1" means that the withdrawable object cart is pulled out.
Object Ready (Objectx Ready status In")		A link to a physical digital input. Indicates that status of the monitored object. "1" means that the object is ready and the spring is charged for a close command.
Synchrocheck permission ("Sync.Check status In")		A link to a physical digital input or a synchrocheck function. "1" means that the synchrocheck conditions are met and the object can be closed.
Objectx Open command ("Objectx Open Command")	OUT1...OUTx	The physical "Open" command pulse to the device's output relay.
Objectx Close command ("Objectx Close Command")		The physical "Close" command pulse to the device's output relay.

Table. 4.5.3 - 128. Operation settings.

Name	Range	Step	Default	Description
Breaker traverse time	0.02...500.00 s	0.02 s	0.2 s	Determines the maximum time between open and close statuses when the breaker switches. If this set time is exceeded and both open and closed status inputs are active, the status "Bad" is activated in the "Objectx Breaker status" setting. If neither of the status inputs are active after this delay, the status "Intermediate" is activated.
Maximum Close command pulse length	0.02...500.00 s	0.02 s	0.2 s	Determines the maximum length for a Close pulse from the output relay to the controlled object. If the object operates faster than this set time, the control pulse is reset and a status change is detected.
Maximum Open command pulse length	0.02...500.00 s	0.02 s	0.2 s	Determines the maximum length for a Open pulse from the output relay to the controlled object. If the object operates faster than this set time, the control pulse is reset and a status change is detected.
Control termination timeout	0.02...500.00 s	0.02 s	10 s	Determines the control pulse termination timeout. If the object has not changed its status in this given time the function will issue error event and the control is ended. This parameter is common for both open and close commands.
Final trip pulse length	0.00...500.00 s	0.02 s	0.2 s	Determines the length of the final trip pulse length. When the object has executed the final trip, this signal activates. If set to 0 s, the signal is continuous. If auto-recloser function controls the object, "final trip" signal is activated only when there are no automatic reclosings expected after opening the breaker.

Table. 4.5.3 - 129. Control settings (DI and Application).

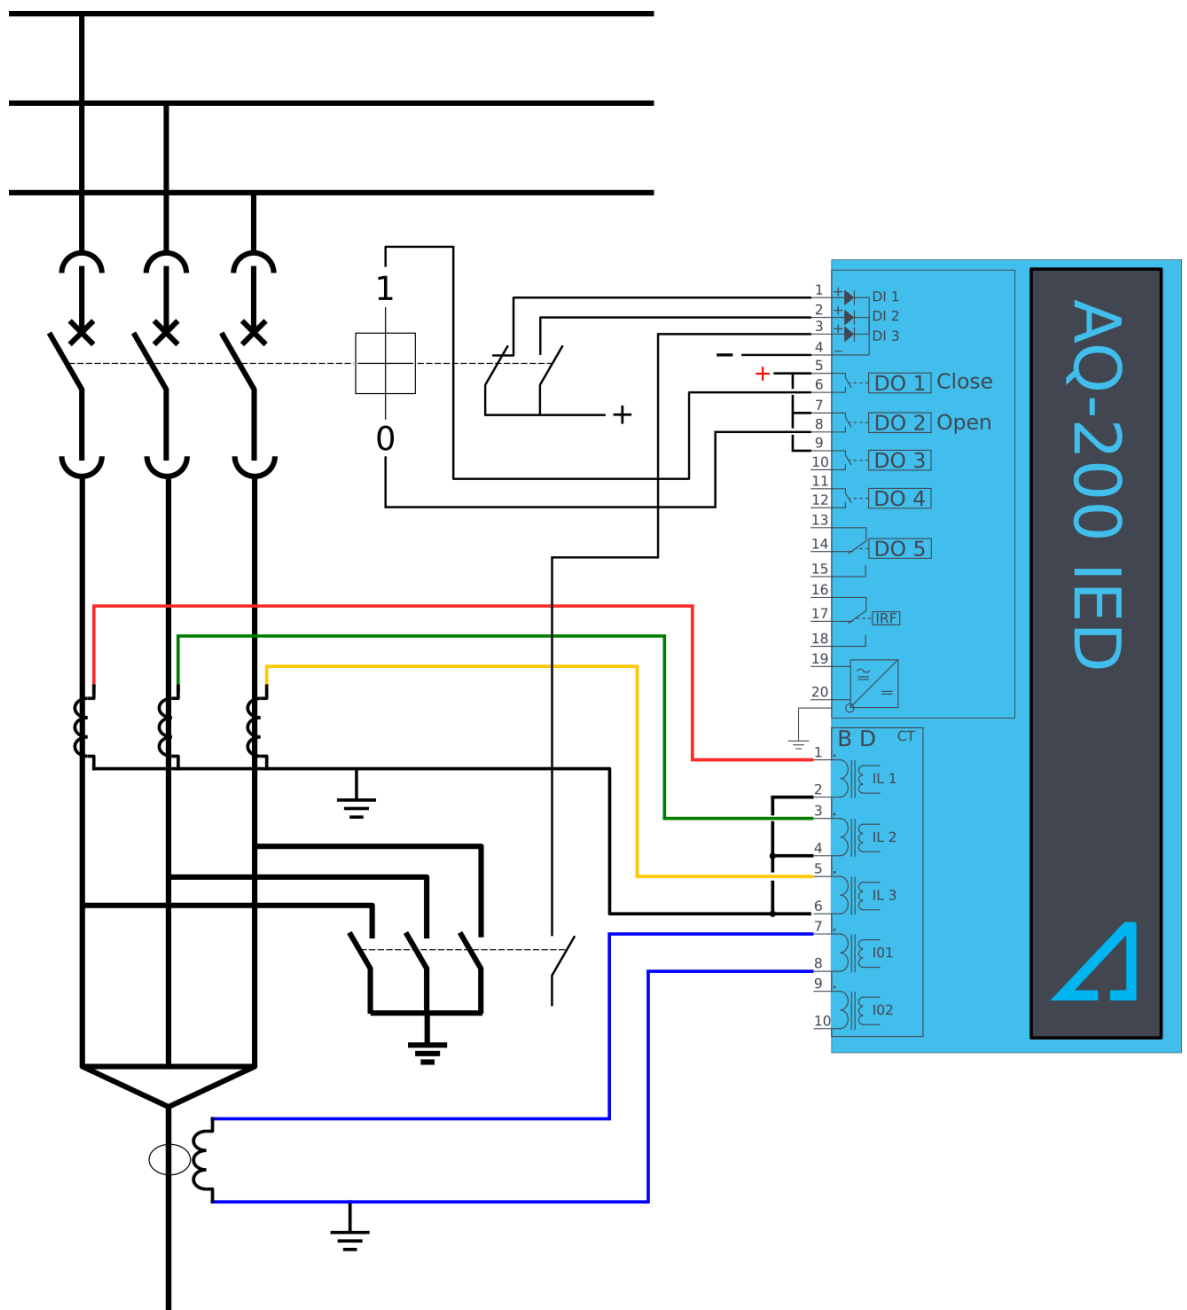

Signal	Range	Description
Access level for MIMIC control	<ul style="list-style-type: none"> User Operator Configurator Super user 	Defines what level of access is required for MIMIC control. The default is the "Configurator" level.
Objectx LOCAL Close control input	Digital input or other logical signal selected by the user	The local Close command from a physical digital input (e.g. a push button).
Objectx LOCAL Open control input		The local Open command from a physical digital input (e.g. a push button).
Objectx REMOTE Close control input		The remote Close command from a physical digital input (e.g. RTU).
Objectx REMOTE Open control input		The remote Open command from a physical digital input (e.g. RTU).
Objectx Application Close		The Close command from the application. Can be any logical signal.
Objectx Application Open		The Open command from the application. Can be any logical signal.

Blocking and interlocking

The interlocking and blocking conditions can be set for each controllable object, with Open and Close set separately. Blocking and interlocking can be based on any of the following: other object statuses, a software function or a digital input.

The image below presents an example of an interlock application, where the closed earthing switch interlocks the circuit breaker close command.

Figure. 4.5.3 - 139. Example of an interlock application.

In order for the blocking signal to be received on time, it has to reach the function 5 ms before the control command.

Events and registers

The object control and monitoring function (abbreviated "OBJ" in event block names) generates events and registers from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

The function also provides a resettable cumulative counter for OPEN, CLOSE, OPEN FAILED, and CLOSE FAILED events.

Table. 4.5.3 - 130. Event messages of the OBJ function instances 1 – 5.

Event block name	Description
OBJ1...OBJ5	Object Intermediate
OBJ1...OBJ5	Object Open
OBJ1...OBJ5	Object Close
OBJ1...OBJ5	Object Bad
OBJ1...OBJ5	WD Intermediate
OBJ1...OBJ5	WD Out
OBJ1...OBJ5	WD in
OBJ1...OBJ5	WD Bad
OBJ1...OBJ5	Open Request On
OBJ1...OBJ5	Open Request Off
OBJ1...OBJ5	Open Command On
OBJ1...OBJ5	Open Command Off
OBJ1...OBJ5	Close Request On
OBJ1...OBJ5	Close Request Off
OBJ1...OBJ5	Close Command On
OBJ1...OBJ5	Close Command Off

OBJ1...OBJ5	Open Blocked Off
OBJ1...OBJ5	Close Blocked On
OBJ1...OBJ5	Close Blocked Off
OBJ1...OBJ5	Object Ready
OBJ1...OBJ5	Object Not Ready
OBJ1...OBJ5	Sync Ok
OBJ1...OBJ5	Sync Not Ok

Event block name	Description
OBJ1...OBJ5	Open Command Fail
OBJ1...OBJ5	Close Command Fail
OBJ1...OBJ5	Final trip On
OBJ1...OBJ5	Final trip Off
OBJ1...OBJ5	Contact Abrasion Alarm On
OBJ1...OBJ5	Contact Abrasion Alarm Off
OBJ1...OBJ5	Switch Operating Time Exceeded On
OBJ1...OBJ5	Switch Operating Time Exceeded Off
OBJ1...OBJ5	XCBR Loc On
OBJ1...OBJ5	XCBR Loc Off
OBJ1...OBJ5	XSWI Loc On
OBJ1...OBJ5	XSWI LOC Off

The function registers its operation into the last twelve (12) time-stamped registers. The table below presents the structure of the function's register content.

Table. 4.5.3 - 131. Register content.

Name	Description
Date and time	dd.mm.yyyy hh:mm:ss.mss
Event	Event name
Recorded Object opening time	Time difference between the object receiving an "Open" command and the object receiving the "Open" status.
Recorded Object closing time	Time difference between the object receiving a "Close" command and object receiving the "Closed" status.
Object status	The status of the object.
WD status	The status of the withdrawable circuit breaker.
Open fail	The cause of an "Open" command's failure.
Close fail	The cause of a "Close" command's failure.
Open command	The source of an "Open" command.
Close command	The source of an "Open" command.
General status	The general status of the function.

4.5.4 Indicator object monitoring

The indicator object monitoring function takes care of the status monitoring of disconnectors. The function's sole purpose is indication and does not therefore have any control functionality. To control circuit breakers and/or disconnectors, please use the Object control and monitoring function. The monitoring is based on the statuses of the configured device's digital inputs. The number of monitored indicators in a device depends on the device type and available inputs. The status monitoring of one monitored object usually requires two (2) digital inputs. Alternatively, object status monitoring can be performed with a single digital input: the input's active state and its zero state (switched to 1 with a NOT gate in the Logic editor).

The outputs of the function are the monitored indicator statuses (Open, Close, Intermediate and Bad). The setting parameters are static inputs for the function, which can only be changed by the use in the function's setup phase.

The inputs of the function are the binary status indications. The function generates general time stamped ON/OFF events to the common event buffer from each of the following signals: OPEN, CLOSE, BAD and INTERMEDIATE event signals. The time stamp resolution is 1 ms.

Settings

Function uses available hardware and software digital signal statuses. These input signals are also setting parameters for the function.

Table. 4.5.4 - 132. Indicator status.

Name	Range	Default	Description
Indicator name ("Ind. Name")	-	IndX	The user-set name of the object, at maximum 32 characters long.
IndicatorX Object status ("Ind.X Object Status")	<ul style="list-style-type: none"> Intermediate Open Closed Bad 	-	Displays the status of the indicator object. Intermediate status is displayed when neither of the status conditions (open or close) are active. Bad status is displayed when both of the status conditions (open and close) are active.

Table. 4.5.4 - 133. Indicator I/O.

Signal	Range	Description
IndicatorX Open input ("Ind.X Open Status In")	Digital input or other logical signal selected by the user (SWx)	A link to a physical digital input. The monitored indicator's OPEN status. "1" refers to the active "Open" state of the monitored indicator.
IndicatorX Close input ("Ind.X Close Status In")	Digital input or other logical signal selected by the user (SWx)	A link to a physical digital input. The monitored indicator's CLOSE status. "1" refers to the active "Close" state of the monitored indicator.

Events

The indicator object monitoring function (abbreviated "CIN" in event block names) generates events from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

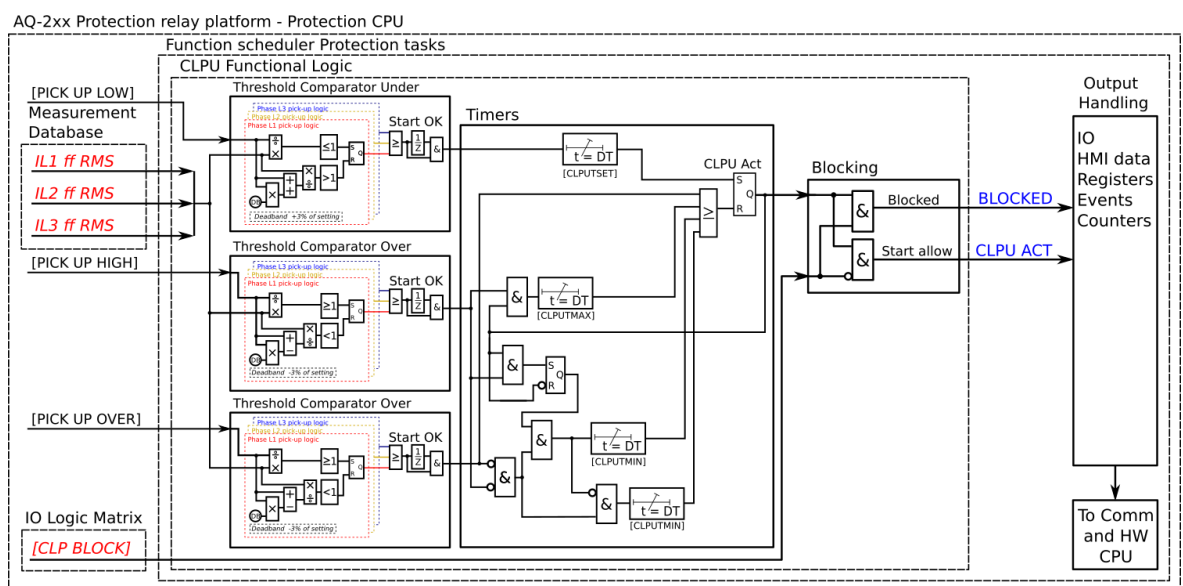

Table. 4.5.4 - 134. Event messages (instances 1 – 5).

Event block name	Event names
CIN1...5	Intermediate
CIN1...5	Open
CIN1...5	Close
CIN1...5	Bad

4.5.5 Cold load pick-up (CLPU)

The cold load pick-up function is used for detecting so-called cold load situations, where a loss of load diversity has occurred after distribution has been re-energized. The characteristics of cold load situations vary according to the types of loads individual feeders have. This means that this function needs to be set specifically according to the load type of the feeder it is monitoring. For example, in residential areas there are relatively many thermostat-controlled devices (such as heating and cooling machinery) which normally run in asynchronous cycles. When restoring power after a longer power outage, these devices demand the full start-up power which can cause the inrush current to be significantly higher than what the load current was before the outage. This is uncommon in industrial environments since the restoring of the production process takes several hours, or even days, and the power level goes back to the level it was before the outage. However, some areas of the industrial network may find the cold load pick-up function useful.

Figure. 4.5.5 - 140. Simplified function block diagram of the cold load pick-up function.

Measured input

The function block uses fundamental frequency component of phase current measurement values.

Table. 4.5.5 - 135. Measurement inputs of the cold load pick-up function.

Signal	Description	Time base
I_{L1RMS}	Fundamental frequency component of phase L1 (A) current	5ms
I_{L2RMS}	Fundamental frequency component of phase L2 (B) current	5ms
I_{L3RMS}	Fundamental frequency component of phase L3 (C) current	5ms

General settings

The following general settings define the general behavior of the function. These settings are static i.e. it is not possible change them by editing the setting group.

Table. 4.5.5 - 136. General settings.

Name	Range	Default	Description
Measurement side	<ul style="list-style-type: none"> Side 1 Side 2 	Side 1	Defines which current measurement module is used by the function. Only visible when there is more than one module.
Condition	<ul style="list-style-type: none"> Normal Curr low Overcurrent On CLPU On CLPU blocked 	Normal	Displays the status of the function.

Pick-up settings

The I_{low} , I_{high} and I_{over} setting parameters control the the pick-up and activation of the cold load pick-up function. They define the maximum and minimum allowed measured current before action from the function. The function constantly calculates the ratio between the setting values and the measured magnitude (I_m) for each of the three phases. The reset ratio of 97 % is built into the function and is always relative to the setting value. The setting value is common for all measured phases. When the I_m exceeds the setting value (in single, dual or all phases) it triggers the pick-up operation of the function.

Setting group selection controls the operating characteristics of the function, i.e. the user or user-defined logic can change function parameters while the function is running.

Table. 4.5.5 - 137. Pick-up settings.

Name	Range	Step	Default	Description
I_{low}	0.01...40.00× I_n	0.01× I_n	0.20× I_n	The pick-up setting for low current detection. All measured currents must be below this setting in order for the cold load pick-up signal to be activated.
I_{high}	0.01...40.00× I_n	0.01× I_n	1.20× I_n	The pick-up setting for high current detection. All measured currents must exceed this setting in order for the cold load pick-up signal to be activated.

Name	Range	Step	Default	Description
I_{over}	0.01...40.00×In	0.01×In	2.00×In	The pick-up setting for overcurrent detection. If this setting is exceeded by any of the measured currents, the cold load pick-up signal is released immediately.

Read-only parameters

The function's *Info* page displays useful, real-time information on the state of the protection function. It is accessed either through the device's HMI display, or through the setting tool software when it is connected to the device and its Live Edit mode is active.

Table. 4.5.5 - 138. Information displayed by the function.

Name	Range	Description
CLP condition	<ul style="list-style-type: none"> • Normal • Curr low • Overcurrent On • CLPU On • CLPU blocked 	Displays status of the control function.

Function blocking

The block signal is checked in the beginning of each program cycle. The blocking signal is received from the blocking matrix in the function's dedicated input. If the blocking signal is not activated when the pick-up element activates, a CLPU ACT signal is generated and the function proceeds to the time characteristics calculation.

If the blocking signal is active when the pick-up element activates, a BLOCKED signal is generated and the function does not process the situation further. If the CLPU ACT function has been activated before the blocking signal, it resets and processes the release time characteristics similarly to when the pick-up signal is reset.

The variables the user can set are binary signals from the system. The blocking signal needs to reach the device minimum of 5 ms before the set operating delay has passed in order for the blocking to activate in time.

Operating time characteristics

The behavior of the function's operating timers can be set for activation as well as for the situation monitoring and release of the cold load pick-up.

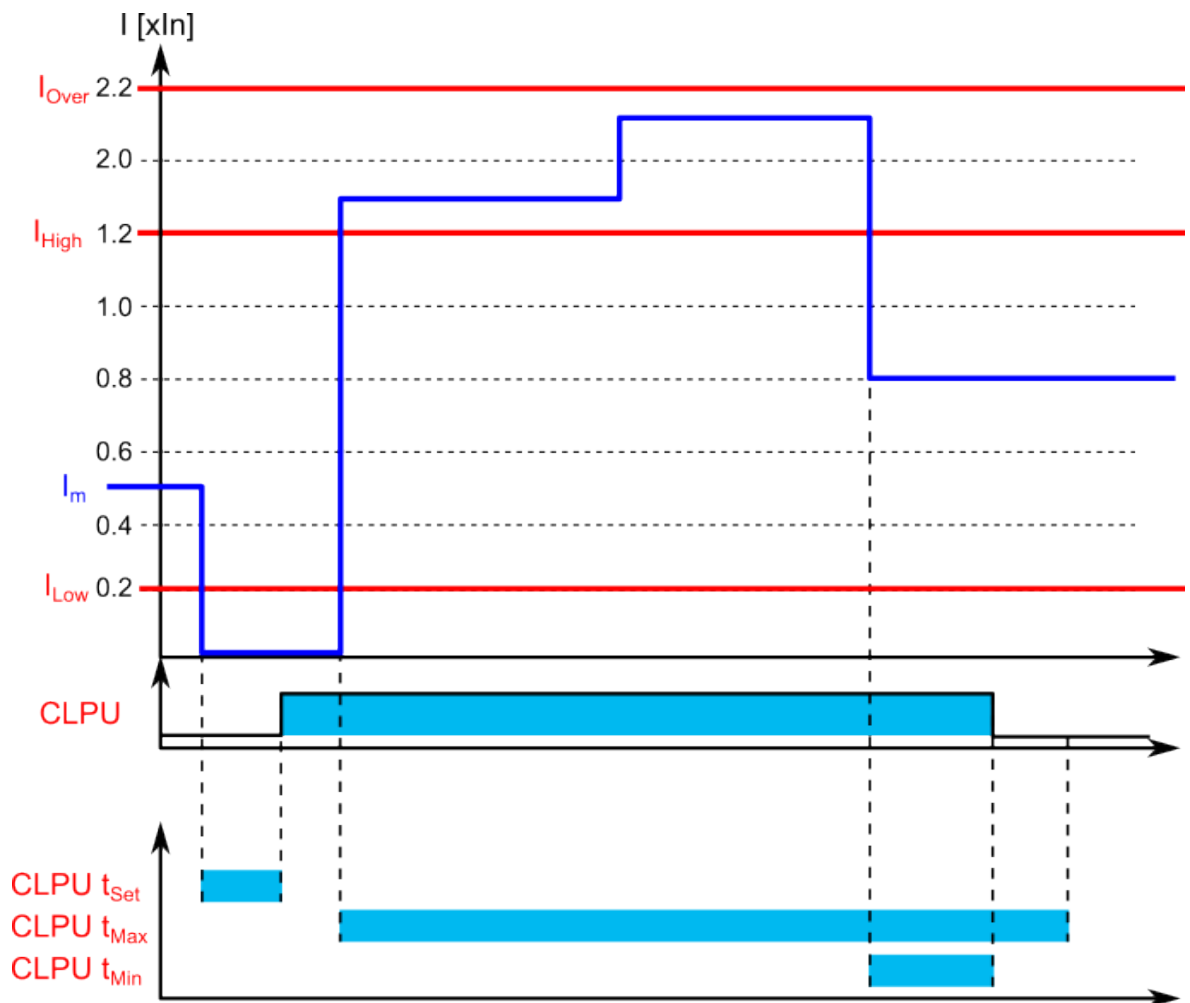

The table below presents the setting parameters for the function's time characteristics.

Table. 4.5.5 - 139. Setting parameters for operating time characteristics.

Name	Range	Step	Default	Description
T _{set}	0.000...1800.000s	0.005s	10.000s	The function's start timer which defines how long the I_{low} condition has to last before the cold load pick-up is activated.
T _{max}	0.000...1800.000s	0.005s	30.000s	The function's maximum timer which defines how long the starting condition can last and for how long the current is allowed to be over I_{high} .
T _{min}	0.000...1800.000s	0.005s	0.040s	The function's minimum timer which defines how long the starting condition has to last at the minimum. If the start-up sequence includes more than one inrush situation, this parameter may be used to prolong the cold load pick-up time over the first inrush. Additionally, this parameter operates as the "reclaim" time for the function in case the inrush current is not immediately initiated in the start-up sequence.

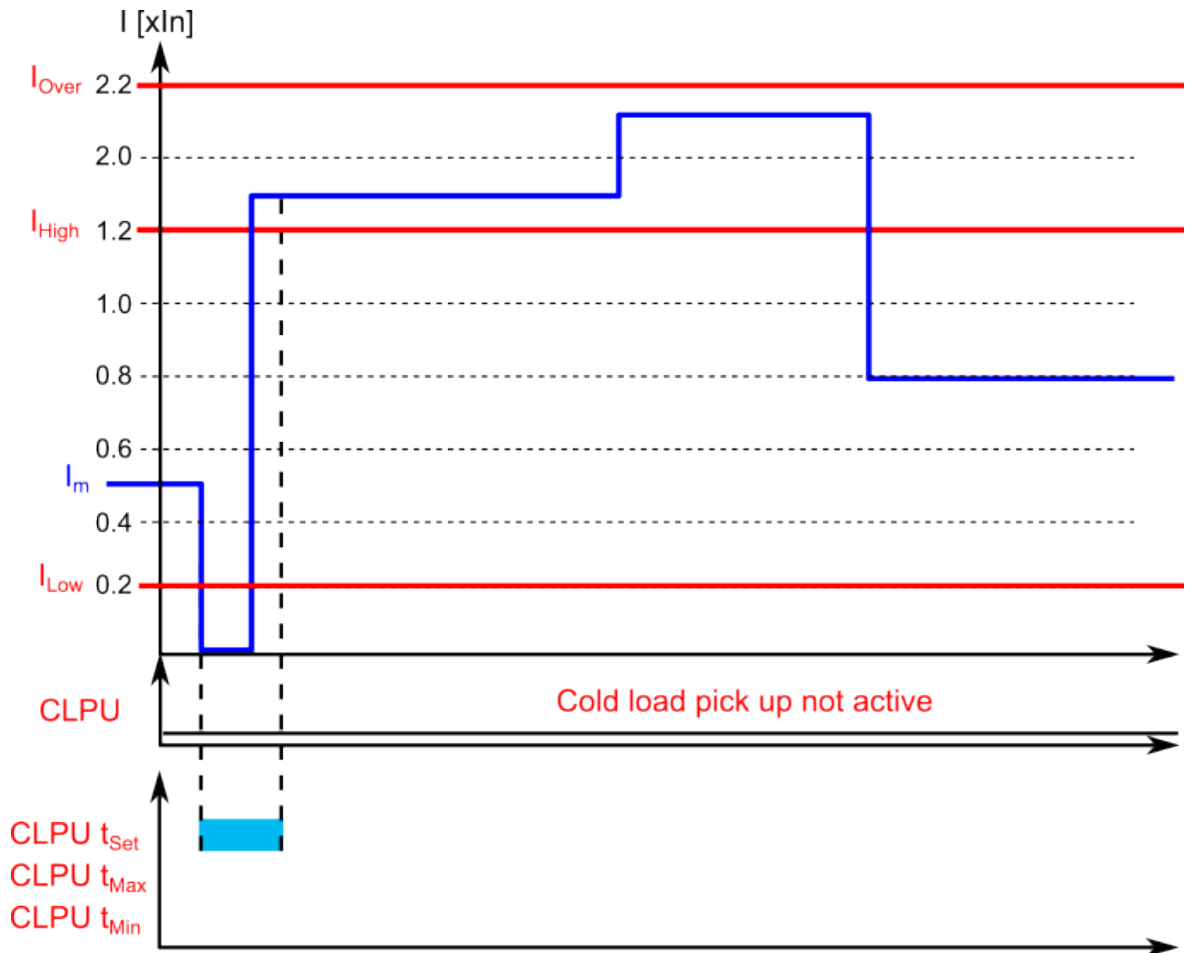

The six examples below showcase some typical cases with the cold load pick-up function.

Figure. 4.5.5 - 141. Example of timers and pick-up parameters (normal CLPU situation).

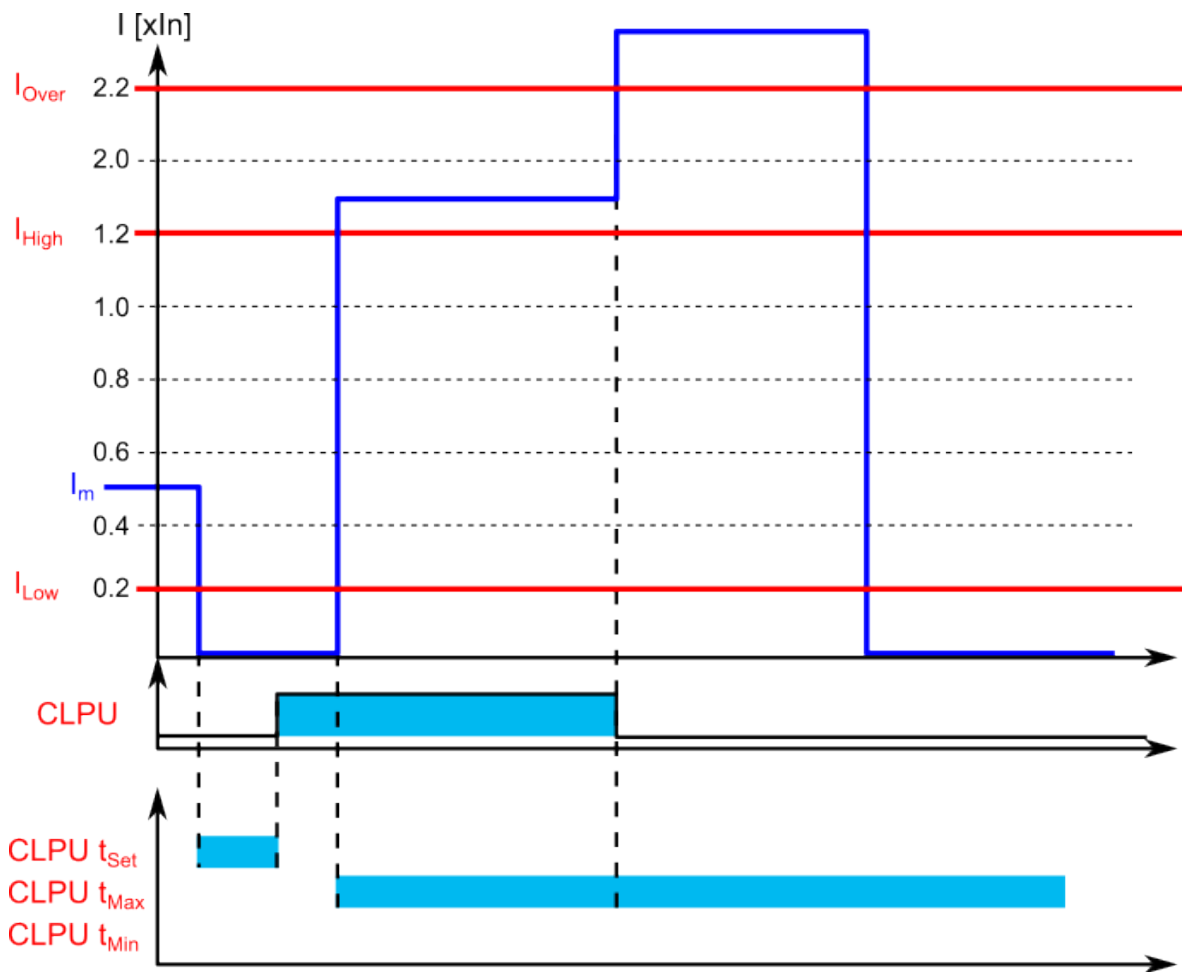

In the example above, the cold load pick-up function activates after the measured current dips below the I_{low} setting and has been there for T_{set} amount of time. When the current exceeds the I_{high} setting value, a timer starts counting towards the T_{max} time. The pick-up current is cleared before the the counter reaches the T_{max} time, when the measured current goes between of I_{low} and the I_{high} . This is when the start-up condition is considered to be over. The cold load pick-up signal can be prolonged beyond this time by setting the T_{min} to a value higher than 0.000 s.

Figure. 4.5.5 - 142. Example of timers and pick-up parameters (no cold load pick-up, I_{low} too short).

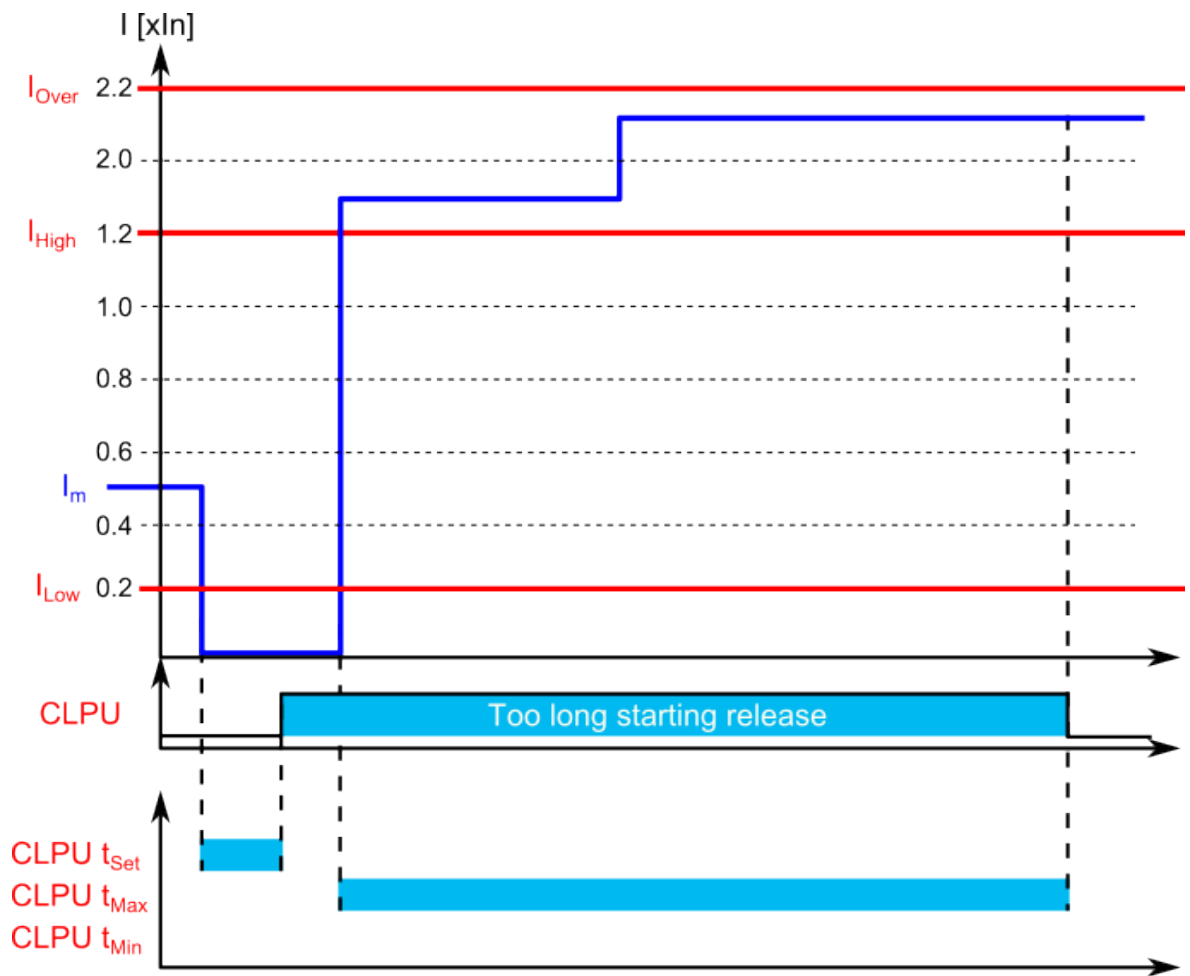

In the example above, the cold load pick-up function does not activate even when the measured current dips below the I_{low} setting, because the T_{set} is not exceeded and therefore no cold load pick-up signal is issued. If the user wants the function to activate within a shorter period of time, the T_{set} parameter can be set to a lower value. If the user wants no delay, the T_{set} can be zero seconds and the operation will be immediate.

Figure. 4.5.5 - 143. Example of timers and pick-up parameters (activated pick-up and instant release due to overcurrent).

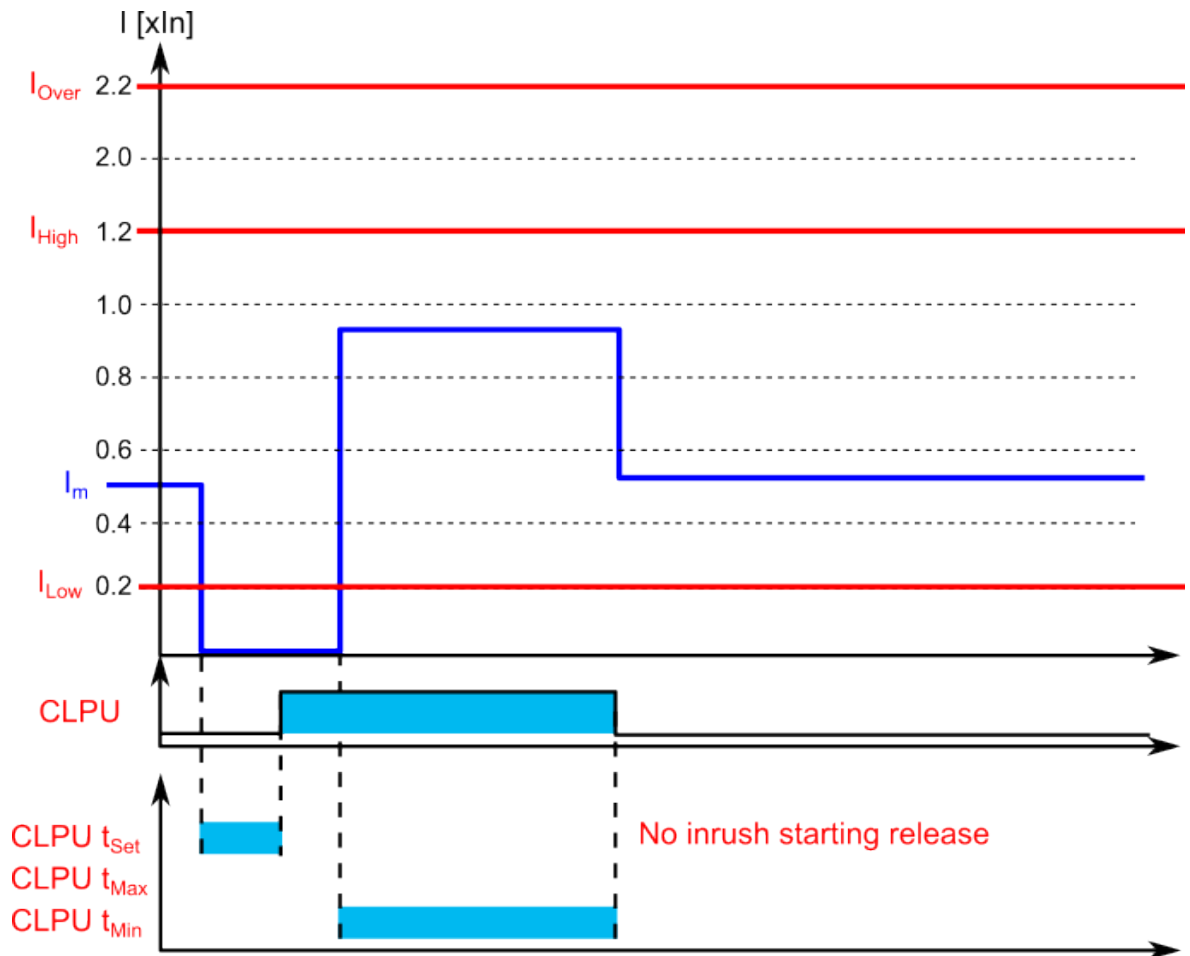

In the example above, the cold load pick-up function activates after the measured current dips below the I_{Low} setting and has been there for T_{Set} amount of time. When the I_m exceeds the I_{High} setting, a counter starts counting towards the T_{max} time. The measured current exceeds the I_{over} setting during the start-up situation and causes the cold load pick-up signal to be released immediately.

Figure. 4.5.5 - 144. Example of timers and pick-up parameters (activated pick-up and instant release due to too long starting).

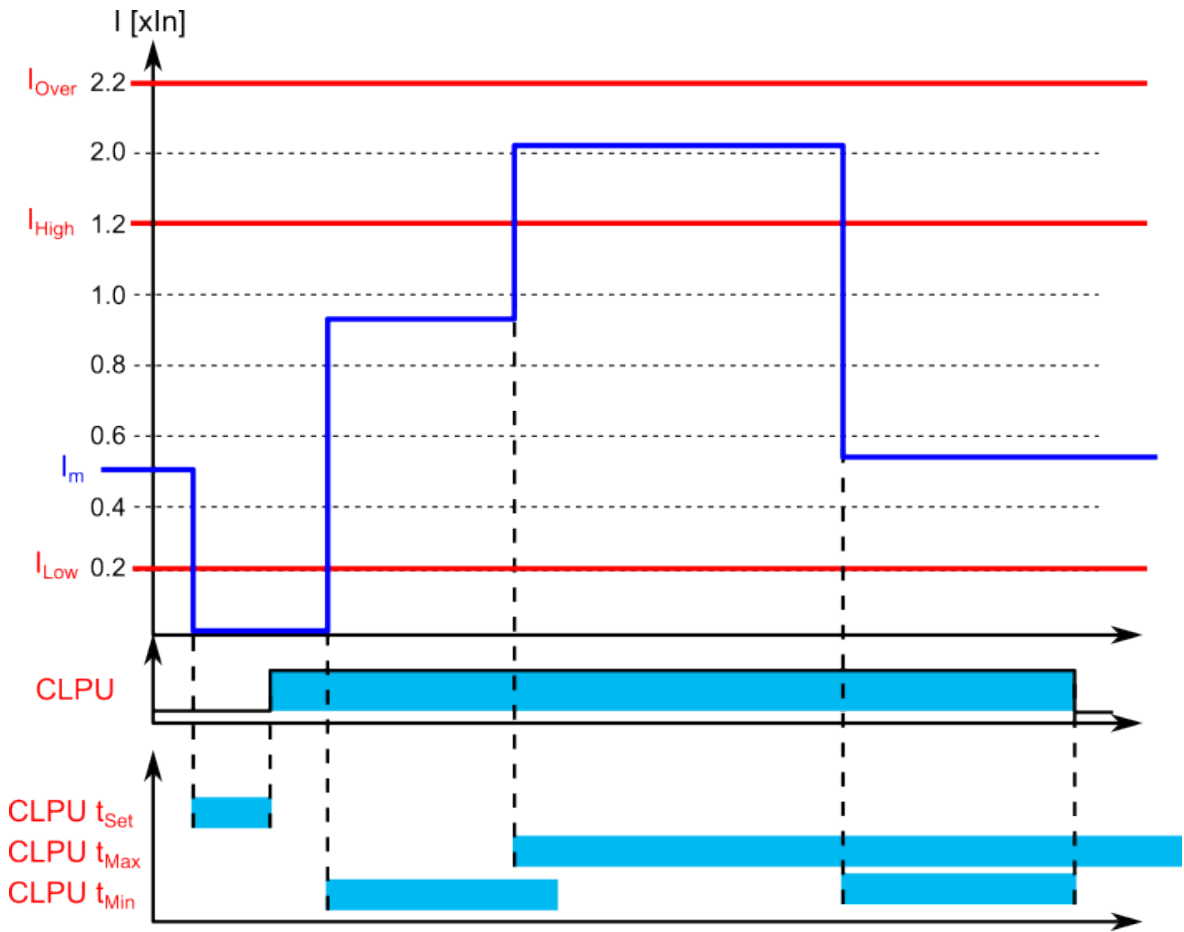

In the example above, the cold load pick-up function activates after the measured current has stayed below the I_{low} setting for a T_{set} amount of time. When the current exceeds the I_{high} setting, a timer starts counting towards the T_{max} time. The measured current stays above the I_{high} setting until the T_{max} is reached, which causes the release of the cold load pick-up signal.

Figure. 4.5.5 - 145. Example of timers and pick-up parameters (no inrush current detected in the starting).

In the example above, the cold load pick-up function activates after the measured current has stayed below the I_{Low} setting for a T_{set} amount of time. The current stays between the I_{Low} setting and the I_{High} setting, so the cold load pick-up signal is active for T_{min} time. As no inrush current is detected during that time, the signal is released.

Figure. 4.5.5 - 146. Example of timers and pick-up parameters (an inrush current detected during T_{min} time).

In the example above, the cold load pick-up function activates after the measured current has stayed below the I_{low} setting for a T_{set} amount of time. The current increases to between the I_{low} setting and the I_{high} setting, which causes a counter to start counting towards the T_{min} time. Before the counter reaches T_{min} , the current exceeds the I_{high} setting, which causes a counter to start counting towards the T_{max} time. The cold load pick-up signal remains active until the T_{max} has been reached, or until the start-up is over and the T_{min} time is over.

Events and registers

The cold load pick-up function (abbreviated "CLP" in event block names) generates events and registers from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

The function's outputs can be used for direct I/O controlling and user logic programming. The function also provides a resettable cumulative counter for the CLPU ACT and BLOCKED events.

Table. 4.5.5 - 140. Event messages.

Event block name	Event names
CLP1	LowStart ON
CLP1	LowStart OFF
CLP1	HighStart ON

Event block name	Event names
CLP1	HighStart OFF
CLP1	LoadNormal ON
CLP1	LoadNormal OFF
CLP1	Overcurrent ON
CLP1	Overcurrent OFF
CLP1	CLPUActivated ON
CLP1	CLPUActivated OFF
CLP1	Block ON
CLP1	Block OFF

The function registers its operation into the last twelve (12) time-stamped registers. The register of the function records the ON event process data for ACTIVATED, BLOCKED, etc. The table below presents the structure of the function's register content.

Table. 4.5.5 - 141. Register content.

Register	Description
Date and time	dd.mm.yyyy hh:mm:ss.mss
Event	Event name
L1/L2/L3 current	Phase currents on trigger time
Time to CLPUact	Time remaining before the function is active
CLPU active time	The time the function has been active before starting
Start-up time	Recorded starting time
Releasing time of CLPU	Reclaim time counter
Setting group in use	Setting group 1...8 active

4.5.6 Milliampere output control

The milliamp current loop is the prevailing process control signal in many industries. It is an ideal method of transferring process information because a current does not change as it travels from a transmitter to a receiver. It is also much more simple and cost-effective.

The benefits of 4...20 mA loops:

- the dominant standard in many industries
- the simplest option to connect and configure
- uses less wiring and connections than other signals, thus greatly reducing initial setup costs
- good for travelling long distances, as current does not degrade over long connections like voltage does
- less sensitive to background electrical noise

- detects a fault in the system incredibly easily since 4 mA is equal to 0 % output.

Milliampere (mA) outputs

AQ-200 series supports up to two (2) independent mA option cards. Each card has four (4) mA output channels and one (1) mA input channel. If the device has an mA option card, enable mA outputs at *Control* → *Device IO* → *mA outputs*. The outputs are activated in groups of two: channels 1 and 2 are activated together, as are channels 3 and 4.

Table. 4.5.6 - 142. Main settings (output channels).

Name		Range	Default	Description
mA option card 1	Enable mA output channels 1 and 2	<ul style="list-style-type: none"> • Disabled • Enabled 	Disabled	Enables and disables the outputs of the mA output card 1.
	Enable mA output channels 3 and 4			
mA option card 2	Enable mA output channels 5 and 6	<ul style="list-style-type: none"> • Disabled • Enabled 	Disabled	Enables and disables the outputs of the mA output card 2.
	Enable mA output channels 7 and 8			

Table. 4.5.6 - 143. Settings for mA output channels.

Name	Range	Step	Default	Description
Enable mA output channel	<ul style="list-style-type: none"> • Disabled • Enabled 	-	Disabled	Enables and disables the selected mA output channel. If the channel is disabled, the channel settings are hidden.
Magnitude selection for mA output channel	<ul style="list-style-type: none"> • Currents • Voltages • Powers • Impedance and admittance • Other 	-	Currents	Defines the measurement category that is used for mA output control.
Magnitude of mA output channel	(dependent on the measurement category selection)	-	(dependent on the measurement category selection)	Defines the measurement magnitude used for mA output control. The available measurements depend on the selection of the "Magnitude selection for mA output channel" parameter.
Input value 1	$-10^7 \dots 10^7$	0.001	0	The first input point in the mA output control curve.
Scaled mA output value 1	0.0000...24.0000mA	0.0001mA	0mA	The mA output value when the measured value is equal to or less than Input value 1.
Input value 2	$-10^7 \dots 10^7$	0.001	1	The second input point in the mA output control curve.
Scaled mA output value 2	0.0000...24.0000mA	0.0001mA	0mA	The mA output value when the measured value is equal to or greater than Input value 2.

Figure. 4.5.6 - 147. Example of the effects of mA output channel settings.

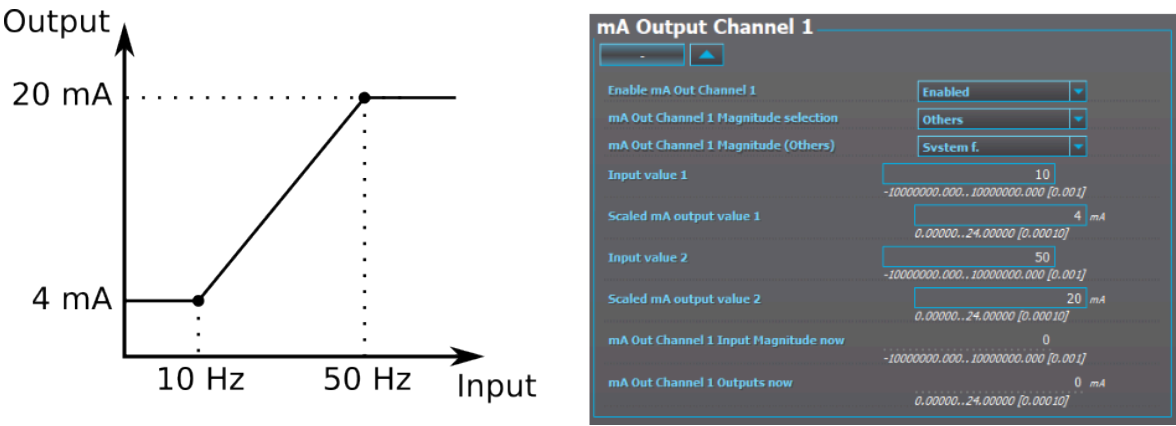

Table. 4.5.6 - 144. Hardware indications.

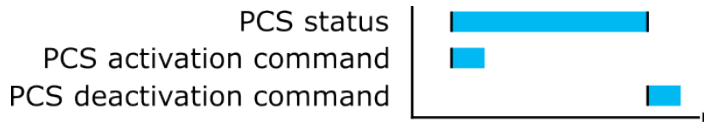

Name	Range	Description
Hardware in mA output channels 1...4	<ul style="list-style-type: none">• None• Slot A• Slot B• Slot C• Slot D• Slot E• Slot F	Indicates the option card slot where the mA output card is located.
Hardware in mA output channels 5...8		

Table. 4.5.6 - 145. Measurement values reported by mA output cards.

Name	Range	Step	Description
mA in Channel 1	0.0000...24.0000mA	0.0001mA	Displays the measured mA value of the selected input channel.
mA in Channel 2			
mA Out Channel Input Magnitude now	$-10^7 \dots 10^7$	0.001	Displays the input value of the selected mA output channel at that moment.
mA Out Channel Outputs now	0.0000...24.0000mA	0.0001mA	Displays the output value of the selected mA output channel at that moment.

4.5.7 Programmable control switch

The programmable control switch is a control function that controls its binary output signal. This output signal can be controlled locally from the device's mimic (displayed as a box in the mimic) or remotely from the RTU. The main purpose of programmable control switches is to block or enable function and to change function properties by changing the setting group. However, this binary signal can also be used for any number of other purposes, just like all other binary signals. Once a programmable control switch has been activated or disabled, it remains in that state until given a new command to switch to the opposite state (see the image below). The switch cannot be controlled by an auxiliary input, such as digital inputs or logic signals; it can only be controlled locally (mimic) or remotely (RTU).

Settings.

These settings can be accessed at *Control* → *Device I/O* → *Programmable control switch*.

Table. 4.5.7 - 146. Settings.

Name	Range	Default	Description
Switch name	-	Switchx	The user-settable name of the selected switch. The name can be up to 32 characters long.
Access level for Mimic control	<ul style="list-style-type: none"> User Operator Configurator Super user 	Configurator	Determines which access level is required to be able to control the programmable control switch via the Mimic.

Events

The programmable control switch function (abbreviated "PCS" in event block names) generates events from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp. The function offers five (5) independent switches. The function's output signals can be used for direct I/O controlling and user logic programming.

Table. 4.5.7 - 147. Event messages.

Event block name	Event names
PCS	Switch 1 ON
PCS	Switch 1 OFF
PCS	Switch 2 ON
PCS	Switch 2 OFF
PCS	Switch 3 ON
PCS	Switch 3 OFF
PCS	Switch 4 ON

Event block name	Event names
PCS	Switch 4 OFF
PCS	Switch 5 ON
PCS	Switch 5 OFF

4.5.8 Analog input scaling curves

Sometimes when measuring with RTD inputs, milliampere inputs and digital inputs the measurement might be inaccurate because the signal coming from the source is inaccurate. One common example of this is tap changer location indication signal not changing linearly from step to step. If the output difference between the steps are not equal to each other, measuring the incoming signal accurately is not enough. "Analog input scaling curves" menu can be used to take these inaccuracies into account.

Analog input scaling curve settings can be found at *Measurement* → *AI(mA, DI volt) scaling* menu.

Currently following measurements can be scaled with analog input scaling curves:

- RTD inputs and mA inputs in "RTD & mA input" option cards
- mA inputs in "4x mA output & 1x mA input" option cards
- mA input in "4x mA input & 1x mA output" option cards
- Digital input voltages

Table. 4.5.8 - 148. Main settings (input channel).

Name	Range	Step	Default	Description
Analog input scaling	<ul style="list-style-type: none"> • Disabled • Activated 	-	Disabled	Enables and disables the input.
Scaling curve 1...10	<ul style="list-style-type: none"> • Disabled • Activated 	-	Disabled	Enables and disables the scaling curve and the input measurement.

Name	Range	Step	Default	Description
Curve 1...10 input signal select	<ul style="list-style-type: none"> • S7 mA Input • S8 mA Input • S15 mA Input • S16 mA Input • DI1...DI20 Voltage • RTD S1...S16 Resistance • mA In 1 (I card 1) • mA In 2 (I card 2) • mA In 1 (T card 1) • mA In 2 (T card 1) • mA In 3 (T card 1) • mA In 4 (T card 1) • mA In 1 (T card 2) • mA In 2 (T card 2) • mA In 3 (T card 2) • mA In 4 (T card 2) 	-	S7 mA Input	Defines the measurement used by scaling curve.
Curve 1...10 input signal filtering	<ul style="list-style-type: none"> • No • Yes 	-	No	Enables calculation of the average of received signal.
Curve 1...10 input signal filter time constant	0.005...3800.000 s	0.005 s	1 s	Time constant for input signal filtering. This parameter is visible when "Curve 1...4 input signal filtering" has been set to "Yes".
Curve 1...10 input signal out of range set	<ul style="list-style-type: none"> • No • Yes 	-	No	Enables out of range signals. If input signal is out of minimum and maximum limits, "ASC1...4 input out of range" signal is activated.
Curve1...10 input minimum	-1 000 000.00...1 000 000.00	0.00001	0	Defines the minimum input of the curve. If input is below the set limit, "ASC1...4 input out of range" is activated.
Curve 1...10 input	-1 000 000.00...1 000 000.00	0.00001	-	Displays the input measurement received by the curve.
Curve1...10 input maximum	-1 000 000.00...1 000 000.00	0.00001	0	Defines the maximum input of the curve. If input is above the set limit, "ASC1...4 input out of range" is activated.
Curve1...10 output	-1 000 000.00...1 000 000.00	0.00001	-	Displays the output of the curve.

The input signal filtering parameter calculates the average of received signals according to the set time constant. This is why rapid changes and disturbances (such as fast spikes) are smothered. The Nyquist rate states that the filter time constant must be at least double the period time of the disturbance process signal. For example, the value for the filter time constant is 2 seconds for a 1 second period time of a disturbance oscillation.

$$H(s) = \frac{Wc}{s+Wc} = \frac{1}{1+s/Wc}$$

When the curve signal is out of range, it activates the "ASC1...10 input out of range" signal, which can be used inside logic or with other functions of the device. The signal can be assigned directly to an output relay or to an LED in the I/O matrix. The "Out of range" signal is activated, when the measured signal falls below the set input minimum limit, or when it exceeds the input maximum limit.

If for some reason the input signal is lost, the value is fixed to the last actual measured cycle value. The value does not go down to the minimum if it has been something else at the time of the signal breaking.

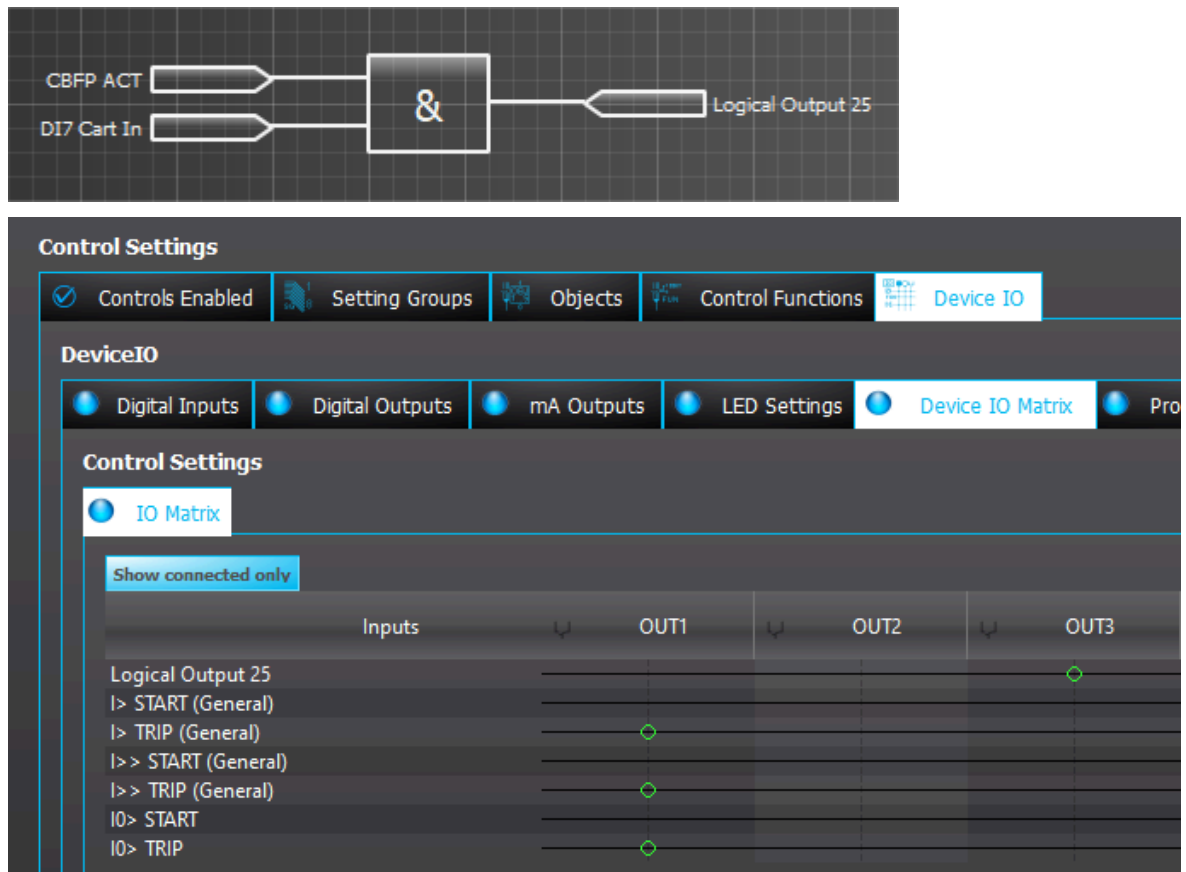

Table. 4.5.8 - 149. Output settings and indications.

Name	Range	Step	Default	Description
Curve 1...10 update cycle	5...10 000ms	5ms	150ms	Defines the length of the input measurement update cycle. If the user wants a fast operation, this setting should be fairly low.
Scaled value handling	<ul style="list-style-type: none"> Floating point Integer out (Floor) Integer (Ceiling) Integer (Nearest) 	-	Floating point	Rounds the milliampere signal output as selected.
Input value 1	0...4000	0.000 01	0	The measured input value at Curve Point 1.
Scaled output value 1	$-10^7 \dots 10^7$	0.000 01	0	Scales the measured milliampere signal at Point 1.
Input value 2	0...4000	0.000 01	1	The measured input value at Curve Point 2.
Scaled output value 1	$-10^7 \dots 10^7$	0.000 01	0	Scales the measured milliampere signal at Point 2.
Add curvepoint 3...20	<ul style="list-style-type: none"> Not used Used 	-	Not used	Allows the user to create their own curve with up to twenty (20) curve points, instead of using a linear curve between two points.

4.5.9 Logical outputs

Logical outputs are used for sending binary signals out from a logic that has been built in the logic editor. Logical signals can be used for blocking functions, changing setting groups, controlling digital outputs, activating LEDs, etc. The status of logical outputs can also be reported to a SCADA system. 32 logical outputs are available. The figure below presents a logic output example where a signal from the circuit breaker failure protection function controls the digital output relay number 3 ("OUT3") when the circuit breaker's cart status is "In".

Figure. 4.5.9 - 148. Logic output example. Logical output is connected to an output relay in matrix.

Logical output descriptions

Logical outputs can be given a description. The user defined description are displayed in most of the menus:

- logic editor
- matrix
- block settings
-
-
- etc.

Table. 4.5.9 - 150. Logical output user description.

Name	Range	Default	Description
User editable description LO1...32	1...31 characters	Logical output 1...32	Description of the logical output. This description is used in several menu types for easier identification.

Events

The logical outputs (abbreviated "LOGIC" in event block names) generates events from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp. The function's output signals can be used for direct I/O controlling and user logic programming.

Table. 4.5.9 - 151. Event messages.

Event block name	Event names
LOGIC1	Logical out 1...32 ON
LOGIC1	Logical out 1...32 OFF

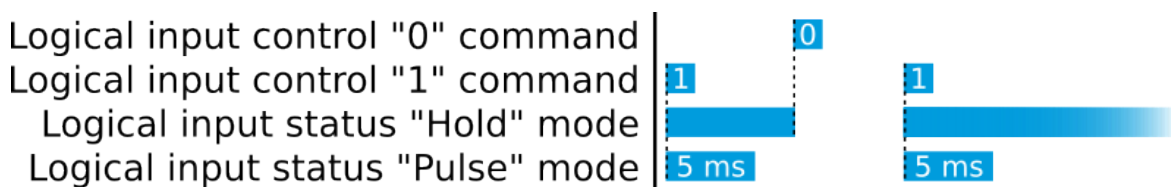

4.5.10 Logical inputs

Logical inputs are binary signals that a user can control manually to change the behavior of the AQ-200 unit or to give direct control commands. Logical inputs can be controlled with a virtual switch built in the mimic and from a SCADA system. Logical inputs are volatile signals: their status will always return to "0" when the AQ-200 device is rebooted. 32 logical inputs are available.

Logical inputs have two modes available: Hold and Pulse. When a logical input which has been set to "Hold" mode is controlled to "1", the input will switch to status "1" and it stays in that status until it is given a control command to go to status "0" or until the device is rebooted. When a logical input which has been set to "Pulse" mode is controlled to "1", the input will switch to status "1" and return back to "0" after 5 ms.

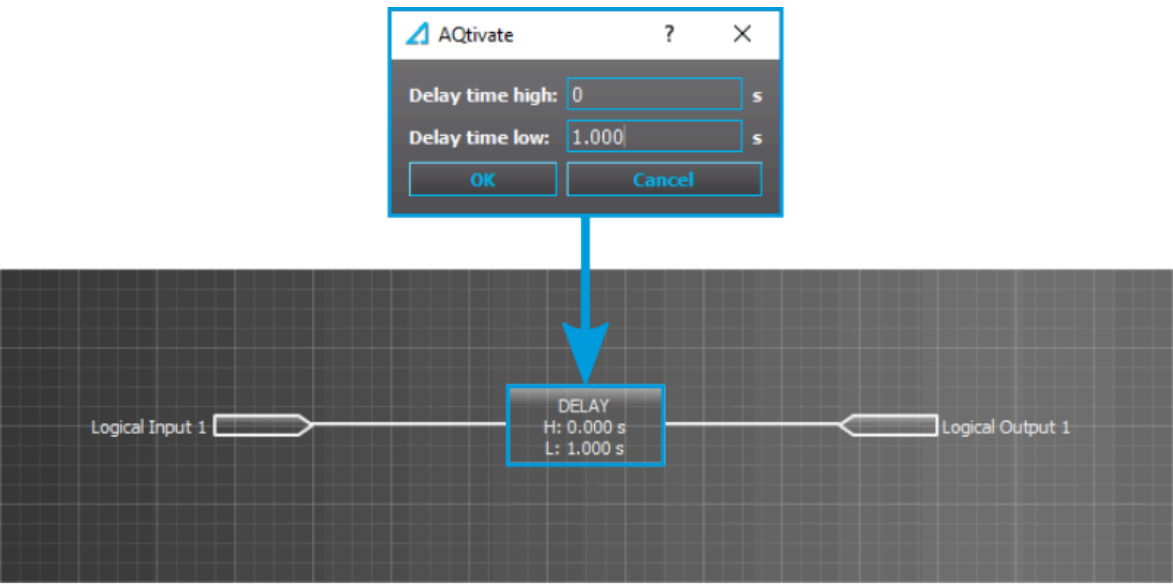

The figure below presents the operation of a logical input in Hold mode and in Pulse mode.

Figure. 4.5.10 - 149. Operation of logical input in "Hold" and "Pulse" modes.

A logical input pulse can also be extended by connecting a DELAY-low gate to a logical output, as has been done in the example figure below.

Figure. 4.5.10 - 150. Extending a logical input pulse.

Logical input control "1" command
Logical input status "Pulse" mode
Logical output status

1

5 ms

Delay low setting

Logical input descriptions

Logical inputs can be given a description. The user defined description are displayed in most of the menus:

- logic editor
- matrix
- block settings
-
-
- etc.

Table. 4.5.10 - 152. Logical input user description.

Name	Range	Default	Description
User editable description LI1...32	1...31 characters	Logical input 1...32	Description of the logical input. This description is used in several menu types for easier identification.

Events

The logical outputs (abbreviated "LOGIC" in event block names) generates events from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp. The function's output signals can be used for direct I/O controlling and user logic programming.

Table. 4.5.10 - 153. Event messages.

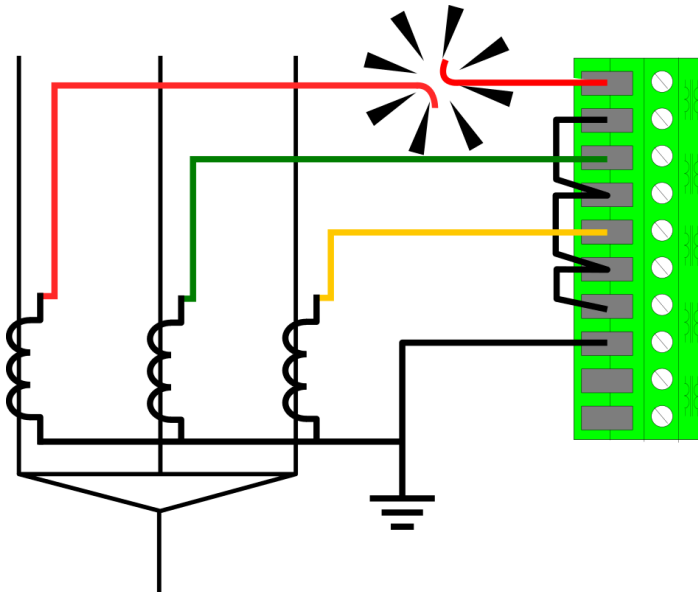

Event block name	Event names
LOGIC2	Logical in 1...32 ON
LOGIC2	Logical in 1...32 OFF

4.6 Monitoring functions

4.6.1 Current transformer supervision

The current transformer supervision function (abbreviated CTS in this document) is used for monitoring the CTs as well as the wirings between the device and the CT inputs for malfunctions and wire breaks. An open CT circuit can generate dangerously high voltages into the CT secondary side, and cause unintended activations of current balance monitoring functions.

Figure. 4.6.1 - 151. Secondary circuit fault in phase L1 wiring.

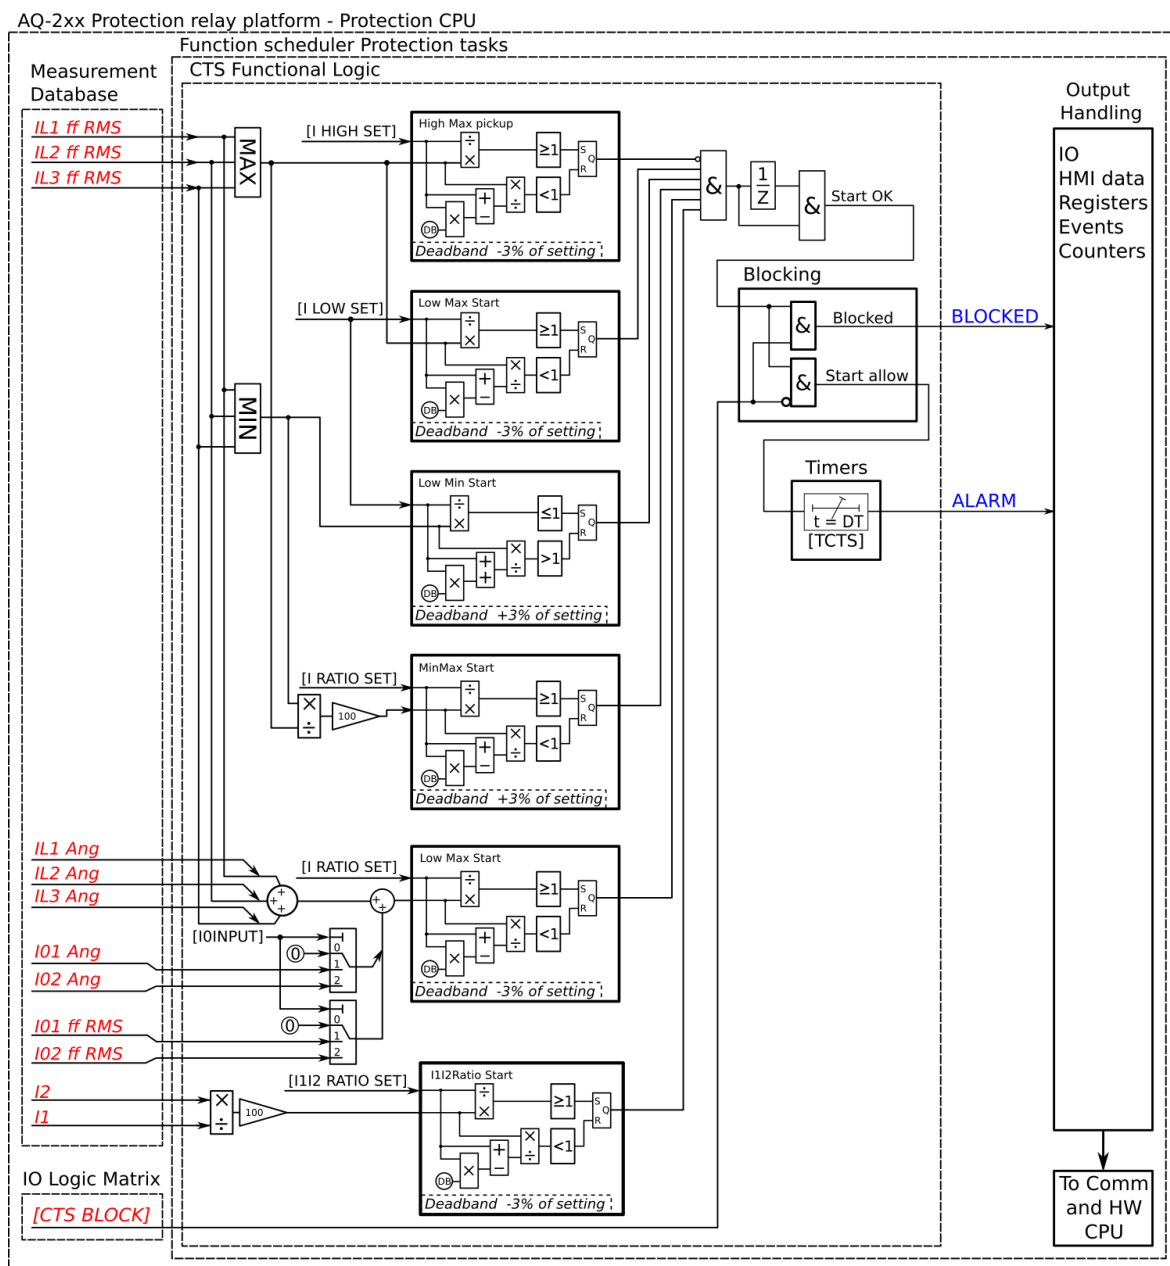

The function constantly monitors the instant values and the key calculated magnitudes of the phase currents. Additionally, the residual current circuit can be monitored if the residual current is measured from a dedicated residual current CT. The user can enable and disable the residual circuit monitoring at will.

The following conditions have to met simultaneously for the function alarm to activate:

- None of the three-phase currents exceeds the $I_{set\ high\ limit}$ setting.
- At least one of the three-phase currents exceeds the $I_{set\ low\ limit}$ setting.
- At least one of the three-phase currents are below the $I_{set\ low\ limit}$ setting.
- The ratio between the calculated minum and maximum of the three-phase currents is below the $I_{set\ ratio}$ setting.
- The ratio between the negative sequence and the positive sequence exceeds the $I2/I1\ ratio$ setting.
- The calculated difference ($IL1+IL2+IL3+I0$) exceeds the $I_{sum\ difference}$ setting (optional).
- The above-mentioned condition is met until the set time delay for alarm.

Figure. 4.6.1 - 152. Simplified function block diagram of the CTS function.

Measured input

The function block uses fundamental frequency component of phase current measurement values and residual current measurement values. The function supervises the angle of each current measurement channel. Positive sequence current and negative sequence currents are calculated from the phase currents. The user can select what is used for the residual current measurement: nothing, the IO1 channel, or the IO2 channel.

Table. 4.6.1 - 154. Measured inputs of the CTS function.

Signal	Description	Time base
IL1RMS	Fundamental frequency component of phase L1 (A) current	5ms
IL2RMS	Fundamental frequency component of phase L2 (B) current	5ms

Signal	Description	Time base
I_{L3RMS}	Fundamental frequency component of phase L3 (C) current	5ms
I_{01RMS}	Fundamental frequency component of residual input I01	5ms
I_{02RMS}	Fundamental frequency component of residual input I02	5ms

General settings

The following general settings define the general behavior of the function. These settings are static i.e. it is not possible to change them by editing the setting group.

Table. 4.6.1 - 155. General settings of the function.

Name	Range	Default	Description
CTS force status to	<ul style="list-style-type: none"> Normal Alarm Blocked 	Normal	Force the status of the function. Visible only when <i>Enable stage forcing</i> parameter is enabled in <i>General</i> menu.
I0 input selection	<ul style="list-style-type: none"> Not in use I01 I02 	Not in use	Selects the measurement input for the residual current. If the residual current is measured with a separate CT, the residual current circuit can be monitored with the CTS function as well. However, this does not apply to summing connections (Holmgren, etc.). If the phase current CT is summed with I01 or I02, this selection should be set to "Not in use".
I0 direction	<ul style="list-style-type: none"> Add Subtract 	Add	Defines the polarity of residual current channel connection.
Compensate natural unbalance	<ul style="list-style-type: none"> - Comp 	-	When activated while the line is energized, the currently present calculated residual current is compensated to 0.

Pick-up settings

The I_{set} and I_{0set} setting parameters control the current-dependent pick-up and activation of the current transformer supervision function. They define the minimum and maximum allowed measured current before action from the function. The function constantly calculates the ratio between the setting values and the measured magnitude (I_m) for each of the three phases and for the selected residual current input. The reset ratio of 97 % and 103% are built into the function and is always relative to the I_{set} value. The setting value is common for all measured amplitudes, and when the I_m exceeds the I_{set} value (in single, dual or all currents) it triggers the pick-up operation of the function.

Setting group selection controls the operating characteristics of the function, i.e. the user or user-defined logic can change function parameters while the function is running.

Table. 4.6.1 - 156. Pick-up settings.

Name	Range	Step	Default	Description
I_{set} high limit	$0.01 \dots 40.00 \times I_N$	$0.01 \times I_N$	$1.20 \times I_N$	Determines the pick-up threshold for phase current measurement. This setting limit defines the upper limit for the phase current's pick-up element. If this condition is met, it is considered as fault and the function is not activated.

Name	Range	Step	Default	Description
$I_{\text{set low limit}}$	0.01...40.00× I_n	0.01× I_n	0.10× I_n	Determines the pick-up threshold for phase current measurement. This setting limit defines the lower limit for the phase current's pick-up element. This condition has to be met for the function to activate.
$I_{\text{set ratio}}$	0.01...100.00%	0.01%	10.00%	Determines the pick-up ratio threshold between the minimum and maximum values of the phase current. This condition has to be met for the function to activate.
$I_{2/I1 \text{ ratio}}$	0.01...100.00%	0.01%	49.00%	Determines the pick-up ratio threshold for the negative and positive sequence currents calculated from the phase currents. This condition has to be met for the function to activate. The ratio is 50 % for a full single-phasing fault (i.e. when one of the phases is lost entirely). Setting this at 49 % allows a current of $0.01 \times I_n$ to flow in one phase, while the other two are at nominal current.
$I_{\text{sum difference}}$	0.01...40.00× I_n	0.01× I_n	0.10× I_n	Determines the pick-up ratio threshold for the calculated residual phase current and the measured residual current. If the measurement circuit is healthy, the sum of these two currents should be 0.
Time delay for alarm	0.000...1800.000s	0.005s	0.5s	Determines the delay between the activation of the function and the alarm.

Read-only parameters

The function's *Info* page displays useful, real-time information on the state of the protection function. It is accessed either through the device's HMI display, or through the setting tool software when it is connected to the device and its Live Edit mode is active.

Table. 4.6.1 - 157. Information displayed by the function.

Name	Range	Step	Description
Uncompensated residual unbalance Pri	<ul style="list-style-type: none"> Normal Start Trip Blocked 	-	Displays the natural unbalance of current after compensating it with <i>Compensate natural unbalance</i> parameter.
Natural unbalance ang	-360.00...360.00 deg	0.01 deg	Displays the natural unbalance of angle after compensating it with <i>Compensate natural unbalance</i> parameter.
Measured current difference $I_{\text{sum, IO}}$	0.00...50.00 × I_n	0.01 × I_n	Current difference between summed phases and residual current.
Measured angle difference $I_{\text{sum, IO}}$	-360...360 deg	0.01 deg	Angle difference between summed phases and residual current.

Function blocking

The block signal is checked in the beginning of each program cycle. The blocking signal is received from the blocking matrix in the function's dedicated input. If the blocking signal is not activated when the pick-up element activates, a START signal is generated and the function proceeds to the time characteristics calculation.

If the blocking signal is active when the pick-up element activates, a BLOCKED signal is generated and the function does not process the situation further. If the START function has been activated before the blocking signal, it resets and the release time characteristics are processed similarly to when the pick-up signal is reset.

The variables the user can set are binary signals from the system. The blocking signal needs to reach the device minimum of 5 ms before the set operating delay has passed in order for the blocking to activate in time.

Operating time characteristics

This function supports definite time delay (DT). For detailed information on this delay type please refer to the chapter "[General properties of a protection function](#)" and its section "Operating time characteristics for trip and reset".

Typical cases of current transformer supervision

The following nine examples present some typical cases of the current transformer supervision and their setting effects.

Figure. 4.6.1 - 153. All works properly, no faults.

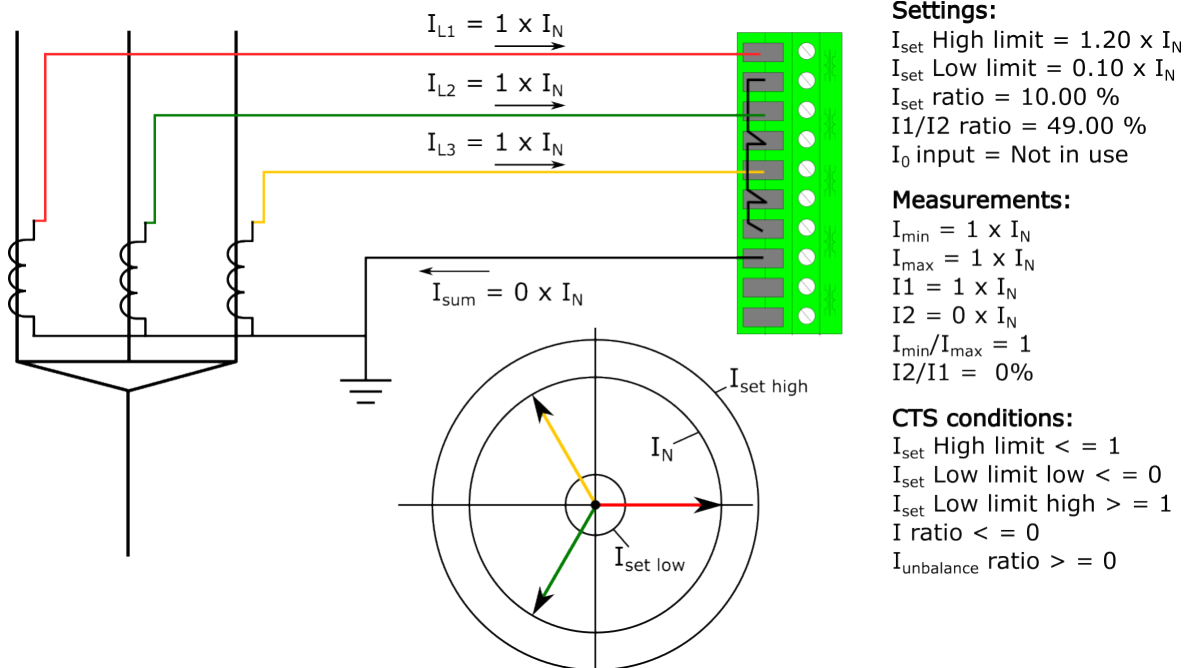

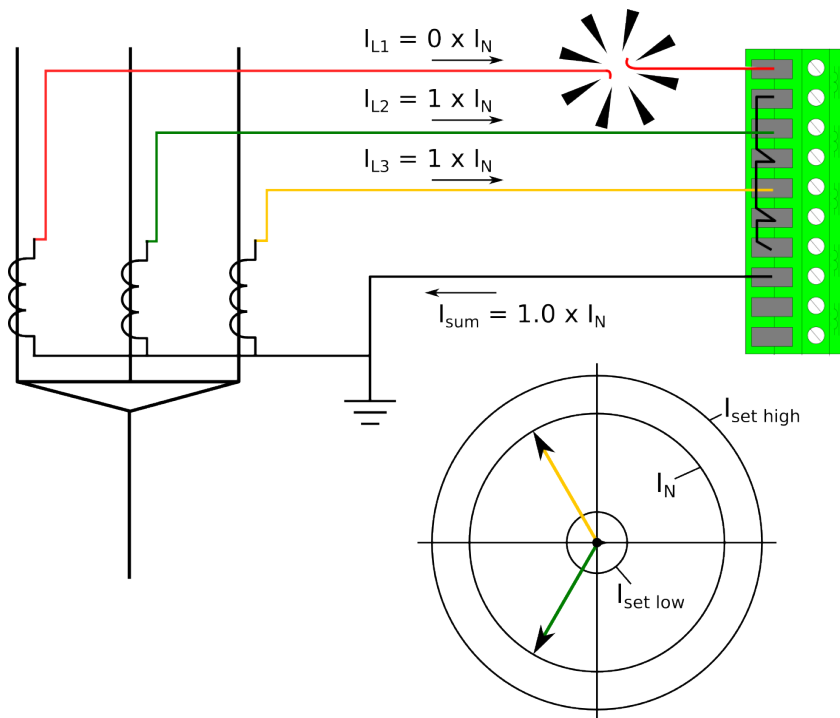

Figure. 4.6.1 - 154. Secondary circuit fault in phase L1 wiring.

**Settings:**

$I_{set} \text{ High limit} = 1.20 \times I_N$
 $I_{set} \text{ Low limit} = 0.10 \times I_N$
 $I_{set} \text{ ratio} = 10.00 \%$
 $I1/I2 \text{ ratio} = 49.00 \%$
 $I_0 \text{ input} = \text{Not in use}$

Measurements:

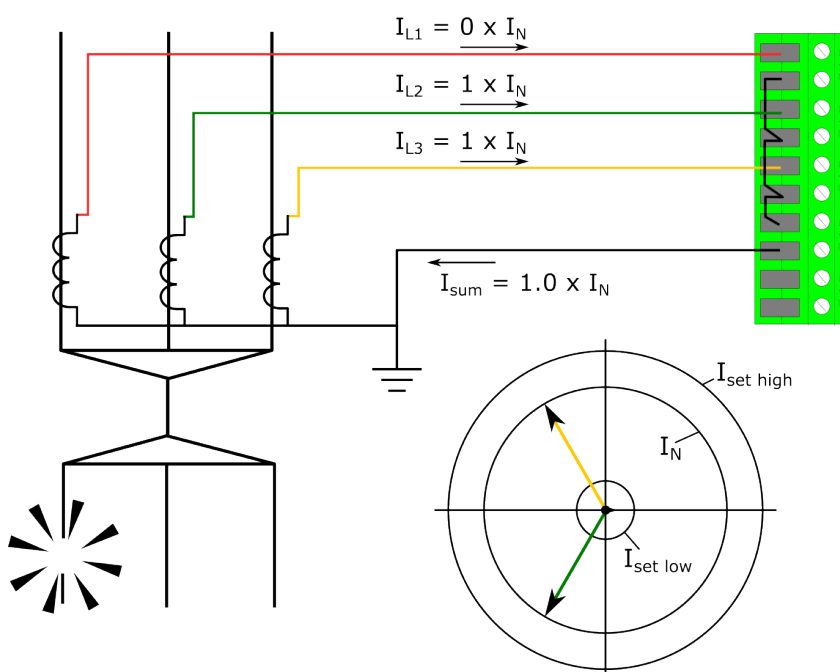

$I_{min} = 0 \times I_N$
 $I_{max} = 1 \times I_N$
 $I1 = 0.67 \times I_N$
 $I2 = 0.33 \times I_N$
 $I_{min}/I_{max} = 0$
 $I2/I1 = 50\%$

CTS conditions:

$I_{set} \text{ High limit} < = 1$
 $I_{set} \text{ Low limit low} < = 1$
 $I_{set} \text{ Low limit high} > = 1$
 $I \text{ ratio} < = 1$
 $I_{unbalance} \text{ ratio} > = 1$

When a fault is detected and all conditions are met, the CTS timer starts counting. If the situation continues until the set time has passed, the function issues an alarm.

Figure. 4.6.1 - 155. Primary circuit fault in phase L1 wiring.

**Settings:**

$I_{set} \text{ High limit} = 1.20 \times I_N$
 $I_{set} \text{ Low limit} = 0.10 \times I_N$
 $I_{set} \text{ ratio} = 10.00 \%$
 $I1/I2 \text{ ratio} = 49.00 \%$
 $I_0 \text{ input} = \text{Not in use}$

Measurements:

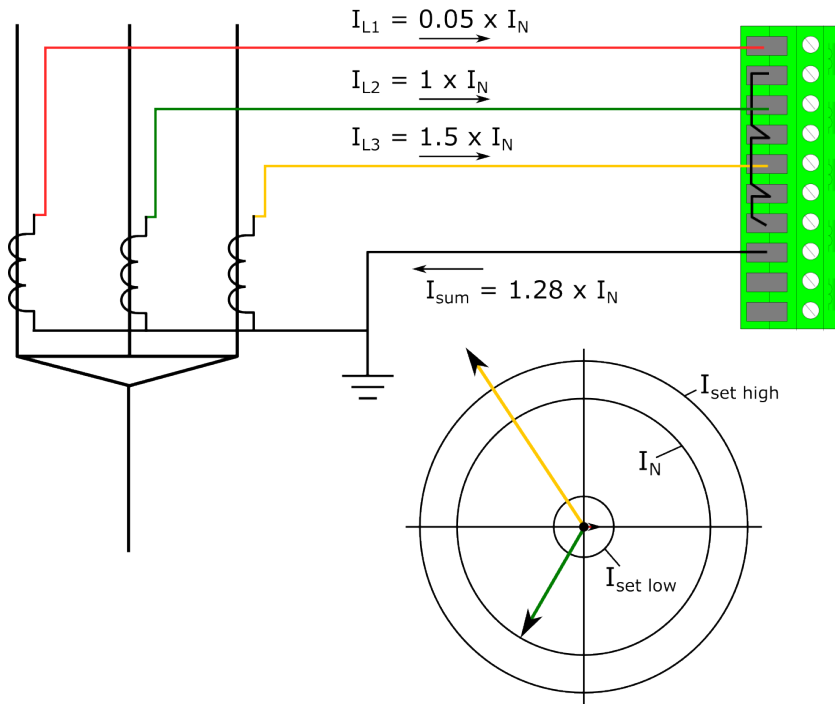

$I_{min} = 0 \times I_N$
 $I_{max} = 1 \times I_N$
 $I1 = 0.67 \times I_N$
 $I2 = 0.33 \times I_N$
 $I_{min}/I_{max} = 0$
 $I2/I1 = 50\%$

CTS conditions:

$I_{set} \text{ High limit} < = 1$
 $I_{set} \text{ Low limit low} < = 1$
 $I_{set} \text{ Low limit high} > = 1$
 $I \text{ ratio} < = 1$
 $I_{unbalance} \text{ ratio} > = 1$

In this example, distinguishing between a primary fault and a secondary fault is impossible. However, the situation meets the function's activation conditions, and if this state (secondary circuit fault) continues until the set time has passed, the function issues an alarm. This means that the function supervises both the primary and the secondary circuit.

Figure. 4.6.1 - 156. No wiring fault but heavy unbalance.

Settings:

I_{set} High limit = $1.20 \times I_N$
 I_{set} Low limit = $0.10 \times I_N$
 I_{set} ratio = 10.00 %
 $I1/I2$ ratio = 49.00 %
 I_0 input = Not in use

Measurements:

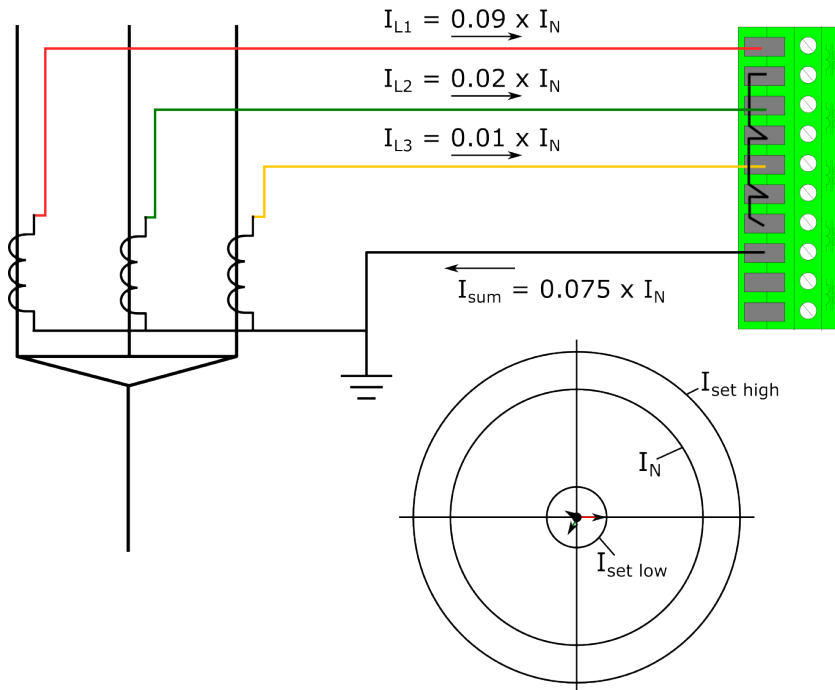

$I_{min} = 0.05 \times I_N$
 $I_{max} = 1.50 \times I_N$
 $I1 = 0.85 \times I_N$
 $I2 = 0.43 \times I_N$
 $I_{min}/I_{max} = 0.7 \%$
 $I2/I1 = 50.03 \%$

CTS conditions:

I_{set} High limit ≤ 0
 I_{set} Low limit low ≤ 1
 I_{set} Low limit high > 1
 I ratio ≤ 1
 $I_{unbalance}$ ratio > 1

If any of the phases exceed the $I_{set high}$ limit setting, the operation of the function is not activated. This behavior is applied to short-circuits and earth faults even when the fault current exceeds the $I_{set high}$ limit setting.

Figure. 4.6.1 - 157. Low current and heavy unbalance.

Settings:

I_{set} High limit = $1.20 \times I_N$
 I_{set} Low limit = $0.10 \times I_N$
 I_{set} ratio = 10.00 %
 $I1/I2$ ratio = 49.00 %
 I_0 input = Not in use

Measurements:

$I_{min} = 0.01 \times I_N$
 $I_{max} = 0.09 \times I_N$
 $I1 = 0.04 \times I_N$
 $I2 = 0.03 \times I_N$
 $I_{min}/I_{max} = 11.0 \%$
 $I2/I1 = 62.92 \%$

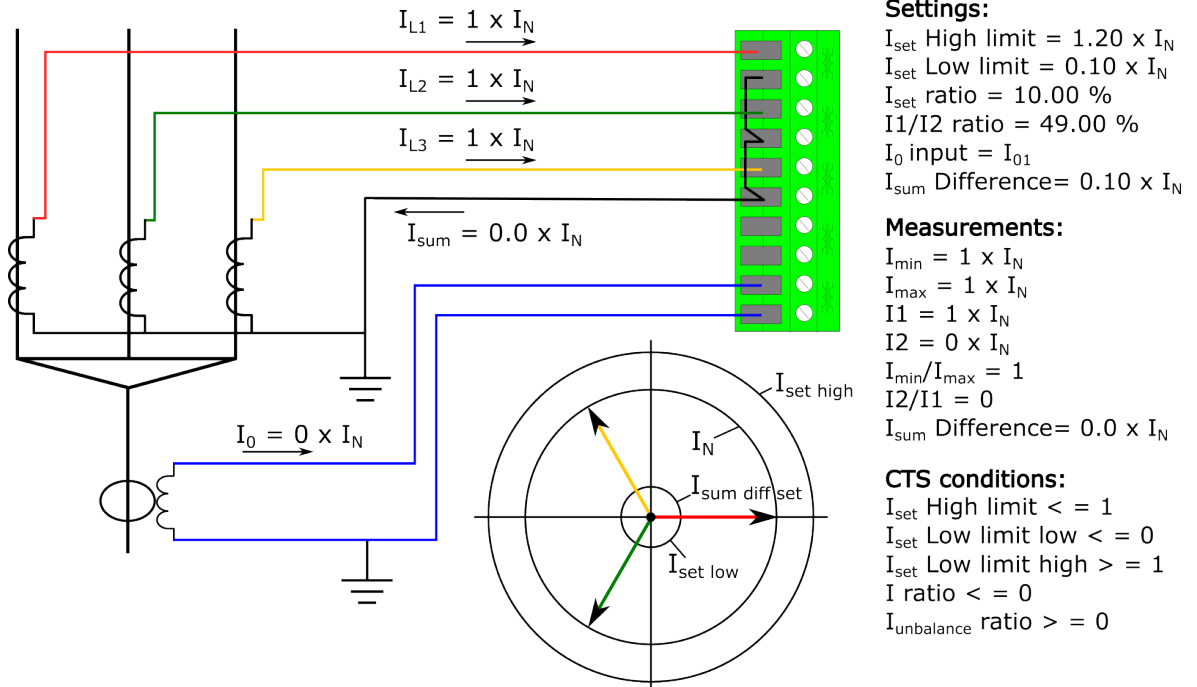

CTS conditions:

I_{set} High limit ≤ 1
 I_{set} Low limit low ≤ 1
 I_{set} Low limit high > 0
 I ratio ≤ 1
 $I_{unbalance}$ ratio > 1

If all of the measured phase magnitudes are below the $I_{set low}$ limit setting, the function is not activated even when the other conditions (inc. the unbalance condition) are met.

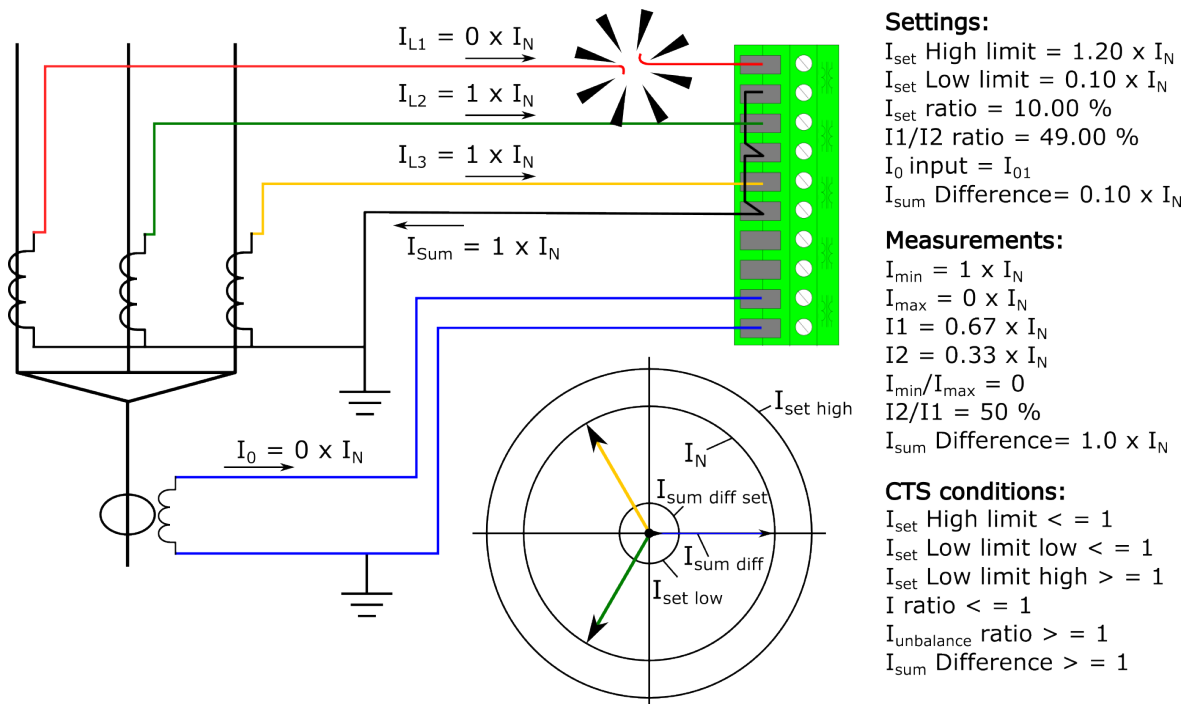

If the I_{set} high limit and I_{set} low limit setting parameters are adjusted according to the application's normal behavior, the operation of the function can be set to be very sensitive for broken circuit and conductor faults.

Figure. 4.6.1 - 158. Normal situation, residual current also measured.

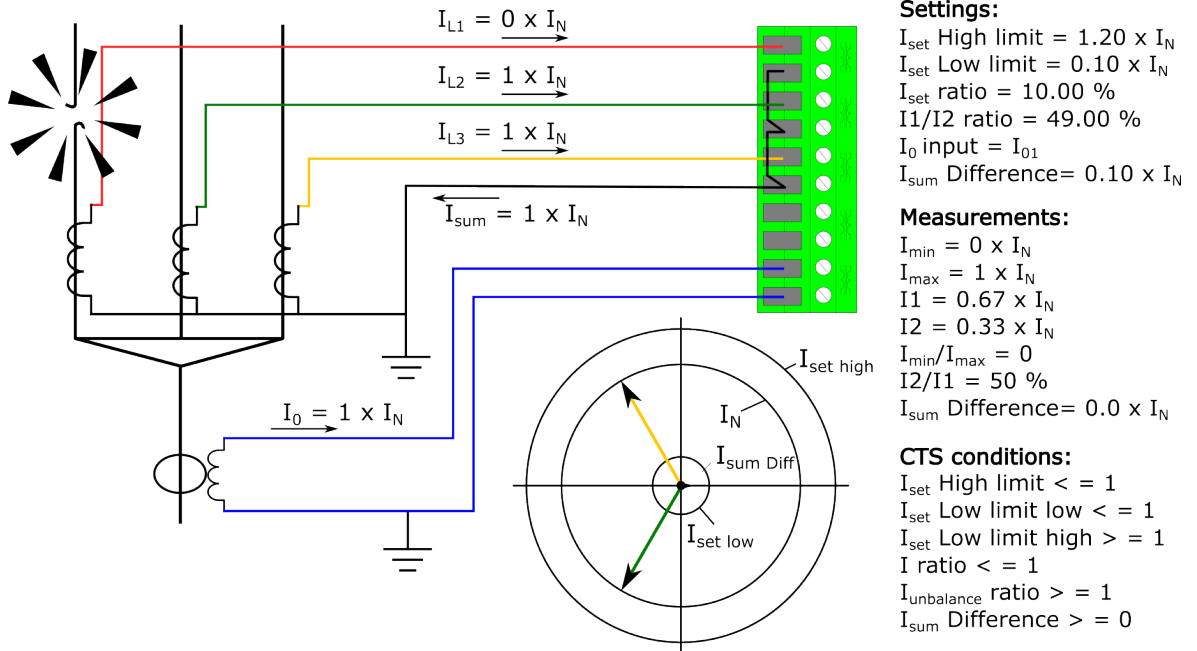

When the residual condition is added with the "I0 input selection", the sum of the current and the residual current are compared against each other to verify the wiring condition.

Figure. 4.6.1 - 159. Broken secondary phase current wiring.

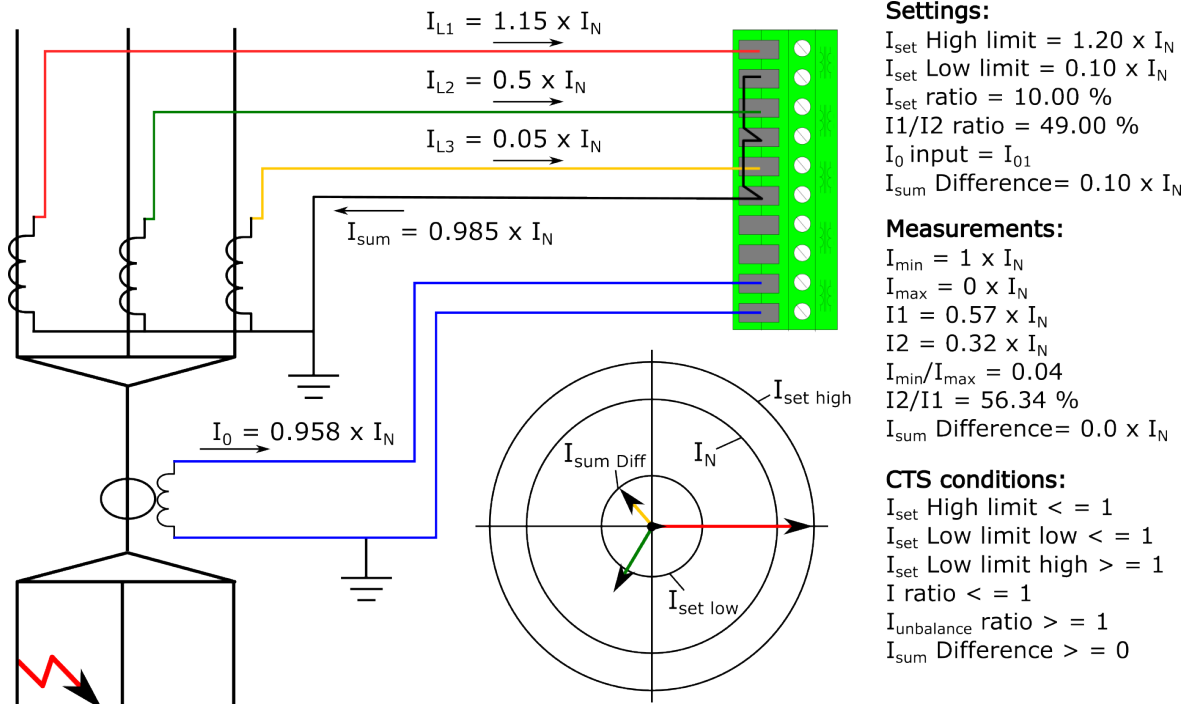

When phase current wire is broken all of the conditions are met in the CTS and alarm shall be issued in case if the situation continues until the set alarming time is met.

Figure. 4.6.1 - 160. Broken primary phase current wiring.

In this example, all other condition are met except the residual difference. That is now $0 \times I_N$, which indicates a primary side fault.

Figure. 4.6.1 - 161. Primary side high-impedance earth fault.

In this example there is a high-impedance earth fault. It does not activate the function, if the measurement conditions are met, while the calculated and measured residual current difference does not reach the limit. The I_{sum} difference setting should be set according to the application in order to reach maximum security and maximum sensitivity for the network earthing.

Events and registers

The current transformer supervision function (abbreviated "CTS" in event block names) generates events and registers from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp. The function offers two (2) independent stages.

The function's outputs can be used for direct I/O controlling and user logic programming. The function also provides a resettable cumulative counter for the CTS ALARM and BLOCKED events.

Table. 4.6.1 - 158. Event messages.

Event block name	Event names
CTS1	Alarm ON
CTS1	Alarm OFF
CTS1	Block ON
CTS1	Block OFF
CTS2	Alarm ON
CTS2	Alarm OFF
CTS2	Block ON
CTS2	Block OFF

The function registers its operation into the last twelve (12) time-stamped registers; this information is available for all provided instances separately. The register of the function records the ON event process data for ACTIVATED, BLOCKED, etc. The table below presents the structure of the function's register content.

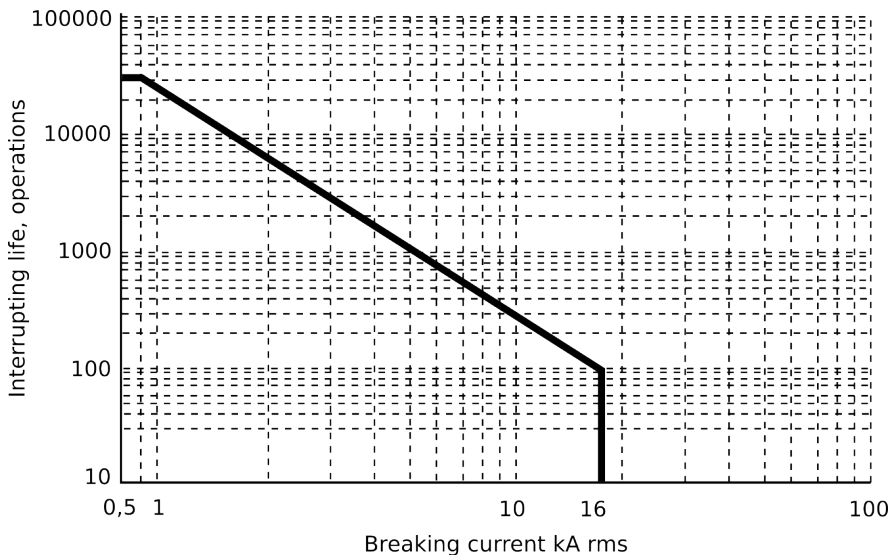

Table. 4.6.1 - 159. Register content.

Register	Description
Date and time	dd.mm.yyyy hh:mm:ss.mss
Event	Event name
Trigger currents	The phase currents (L1, L2 & L3), the residual currents (I01 & I02), and the sequence currents (I1 & I2) on trigger time.
Time to CTSact	Time remaining before alarm activation.
Fault type	The status code of the monitored current.
Setting group in use	Setting group 1...8 active

4.6.2 Circuit breaker wear monitoring

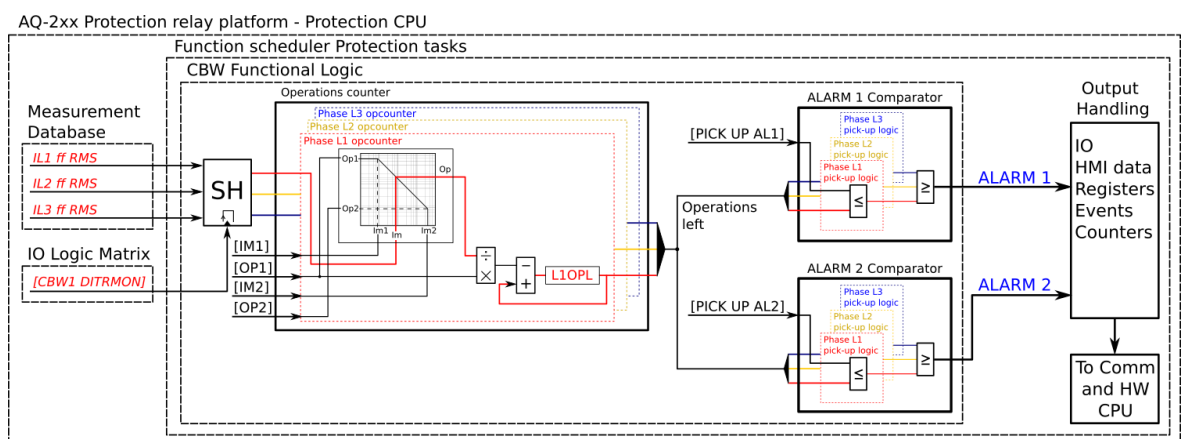

The circuit breaker wear function is used for monitoring the circuit breaker's lifetime and its maintenance needs caused by interrupting currents and mechanical wear. The function uses the circuit breaker's manufacturer-supplied data for the breaker operating cycles in relation to the interrupted current magnitudes.

Figure. 4.6.2 - 162. Example of the circuit breaker interrupting life operations.

The function is triggered from the circuit breaker's "Open" command output and it monitors the three-phase current values in both the tripping moment and the normal breaker opening moment. The maximum value of interrupting life operations for each phase is calculated from these currents. The value is cumulatively deducted from the starting operations starting value. The user can set up two separate alarm levels, which are activated when the value of interrupting life operations is below the setting limit. The "Trip contact" setting defines the output that triggers the current monitoring at the breaker's "Open" command.

Figure. 4.6.2 - 163. Simplified function block diagram of the circuit breaker wear function.

Measured input

The function block uses fundamental frequency component of phase current measurement values.

Table. 4.6.2 - 160. Measurement inputs of the circuit breaker wear function.

Signal	Description	Time base
I_{L1RMS}	Fundamental frequency component of phase L1 (A) current	5ms
I_{L2RMS}	Fundamental frequency component of phase L2 (B) current	5ms
I_{L3RMS}	Fundamental frequency component of phase L3 (C) current	5ms

General settings

The following general settings define the general behavior of the function. These settings are static i.e. it is not possible to change them by switching the setting group.

Table. 4.6.2 - 161. General settings.

Name	Range	Default	Description
CBW force status to	<ul style="list-style-type: none"> Normal Alarm1 On Alarm2 On 	Normal	Force the status of the function. Visible only when <i>Enable stage forcing</i> parameter is enabled in <i>General</i> menu.
CBW in side	<ul style="list-style-type: none"> Side 1 Side 2 	Side 1	Defines which current measurement module is used by the function.

Circuit breaker characteristics settings

The circuit breaker characteristics are set by two operating points, defined by the nominal breaking current, the maximum allowed breaking current and their respective operation settings. This data is provided by the circuit breaker's manufacturer.

Table. 4.6.2 - 162. Settings for circuit breaker characteristics.

Name	Range	Step	Default	Description
Operations 1	0...200 000	1	50 000	The number of interrupting life operations at the nominal current (Close - Open).
Operations 2	0...200 000	1	100	The number of interrupting life operations at the rated breaking current (Open).
Current 1 (I_{nom})	0...100.00kA	0.01kA	1kA	The rated normal current (RMS).
Current 2 (I_{max})	0...100.00kA	0.01kA	20kA	The rated short-circuit breaking current (RMS).

Pick-up settings

For the alarm stages Alarm 1 and Alarm 2, the user can set the pick-up level for the number of operations left. The pick-up setting is common for all phases and the alarm stage picks up if any of the phases goes below this setting.

Table. 4.6.2 - 163. Pick-up settings.

Name	Range	Default	Description
Alarm 1	<ul style="list-style-type: none"> Disabled Enabled 	Disabled	Enable and disable the Alarm 1 stage.
Alarm 1 Set	0...200 000	1 000	Defines the pick-up threshold for remaining operations. When the number of remaining operations is below this setting, the ALARM 1 signal is activated.
Alarm 2	<ul style="list-style-type: none"> Disabled Enabled 	Disabled	Enable and disable the Alarm 2 stage.
Alarm 2 Set	0...200 000	100	Defines the pick-up threshold for remaining operations. When the number of remaining operations is below this setting, the ALARM 2 signal is activated.

Setting example

Let us examine the settings, using a low-duty vacuum circuit breaker as an example. The image below presents the technical specifications provided by the manufacturer, with the data relevant to our settings highlighted in red:

Rated voltage, kV	24
Rated current, A	800
Rated power frequency test voltage, kV	50
Rated frequency, Hz	50/60
Rated impulse test voltage, kV peak	125
Partial discharge level at 1,1 rated voltage kV, pC	<10
Rated short-circuit breaking current, kA	16
Rated short-circuit making current, kA peak	41.5
Short time withstand current, 4s, kA	16
Mechanical life, CO cycles, not less than	30,000
Interrupting life operations, not less than	
at rated current	30,000
at breaking current	100
at other currents	see Fig.41
Closing time, ms, not more than	35
Opening time, ms, not more than	15
Breaking time, ms, not more than	25
Main contact resistance, $\mu\Omega$ m, not more than	40
Maximum ambient temperature, C°	+55
Minimum ambient temperature, C°	-40
Design class (according to IEC 60932)	1
Electrical endurance class at rated IEEE/IEC duty	E2
Mechanical endurance class at rated IEEE/IEC duty	M2
Capacitive current switching class	C2
"Mechanical vibration and shock withstand capability, IEC 60721, IEC 60068"	Class 4M4
Maximum altitude above sea level, m	3000*
Maximum humidity, non condensing	98 %
Weight, kg - LD_1	35
Weight, kg - LD_6	55

Now, we set the stage as follows:

Parameter	Setting
Current 1	0.80 kA
Operation 1	30 000 operations
Current 2	16.00 kA
Operations 2	100 operations
Enable Alarm 1	Enabled
Alarm 1 Set	1000 operations
Enable Alarm 2	Enabled
Alarm 2 Set	100 operations

With these settings, Alarm 1 is issued when the cumulative interruption counter for any of the three phases dips below the set 1000 remaining operations ("Alarm 1 Set"). Similarly, when any of the counters dips below 100 remaining operations, Alarm 2 is issued.

Read-only parameters

The function's *Info* page displays useful, real-time information on the state of the protection function. It is accessed either through the device's HMI display, or through the setting tool software when it is connected to the device and its Live Edit mode is active.

Table. 4.6.2 - 164. Information displayed by the function.

Name	Range	Description
CBW condition	<ul style="list-style-type: none"> • Normal • Alarm1 On • Alarm2 On 	Displays the status of the function.
Breaker operations	-	Cumulative counter of "open" operations.
Alarm 1 counter	-	Alarm 1 operation counter.
Alarm 2 counter	-	Alarm 2 operation counter.
L1 Operations left	-	Operations left for phase L1.
L2 Operations left	-	Operations left for phase L2.
L3 Operations left	-	Operations left for phase L3.

Events and registers

The circuit breaker wear function (abbreviated "CBW" in event block names) generates events and registers from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The function's outputs can be used for direct I/O controlling and user logic programming. The events triggered by the function are recorded with a time stamp.

The function also provides a resettable cumulative counter for the "Open" operations as well as the ALARM 1 and ALARM 2 events.

Table. 4.6.2 - 165. Event messages.

Event block name	Event names
CBW1	CBWEAR1 Triggered
CBW1	CBWEAR1 Alarm 1 ON
CBW1	CBWEAR1 Alarm 1 OFF
CBW1	CBWEAR1 Alarm 2 ON
CBW1	CBWEAR1 Alarm 2 OFF

The function registers its operation into the last twelve (12) time-stamped registers. The register of the function records the ON event process data. The table below presents the structure of the function's register content.

Table. 4.6.2 - 166. Register content.

Register	Description
Date and time	dd.mm.yyyy hh:mm:ss.mss
Event	Event name
Trigger current	Phase currents on trigger time
Deducted Op	L1/L2/L3 Deducted operations from the cumulative sum
Operations left	L1/L2/L3 Operations left

4.6.3 Current total harmonic distortion (THD)

The total harmonic distortion (THD) function is used for monitoring the content of the current harmonic. The THD is a measurement of the harmonic distortion present, and it is defined as the ratio between the sum of all harmonic components' powers and the power of the fundamental frequency (RMS).

Harmonics can be caused by different sources in electric networks such as electric machine drives, thyristor controls, etc. The function's monitoring of the currents can be used to alarm of the harmonic content rising too high; this can occur when there is an electric quality requirement in the protected unit, or when the harmonics generated by the process need to be monitored.

The function constantly measures the phase and residual current magnitudes as well as the harmonic content of the monitored signals up to the 31st harmonic component. When the function is activated, the measurements are also available for the mimic and the measurement views in the HMI carousel. The user can also set the alarming limits for each measured channel if the application so requires.

The monitoring of the measured signals can be selected to be based either on an amplitude ratio or on the above-mentioned power ratio. The difference is in the calculation formula (as shown below):

Figure. 4.6.3 - 164. THD calculation formulas.

$$THD_P = \frac{I_{x2}^2 + I_{x3}^2 + I_{x4}^2 \dots I_{x31}^2}{I_{x1}^2}$$

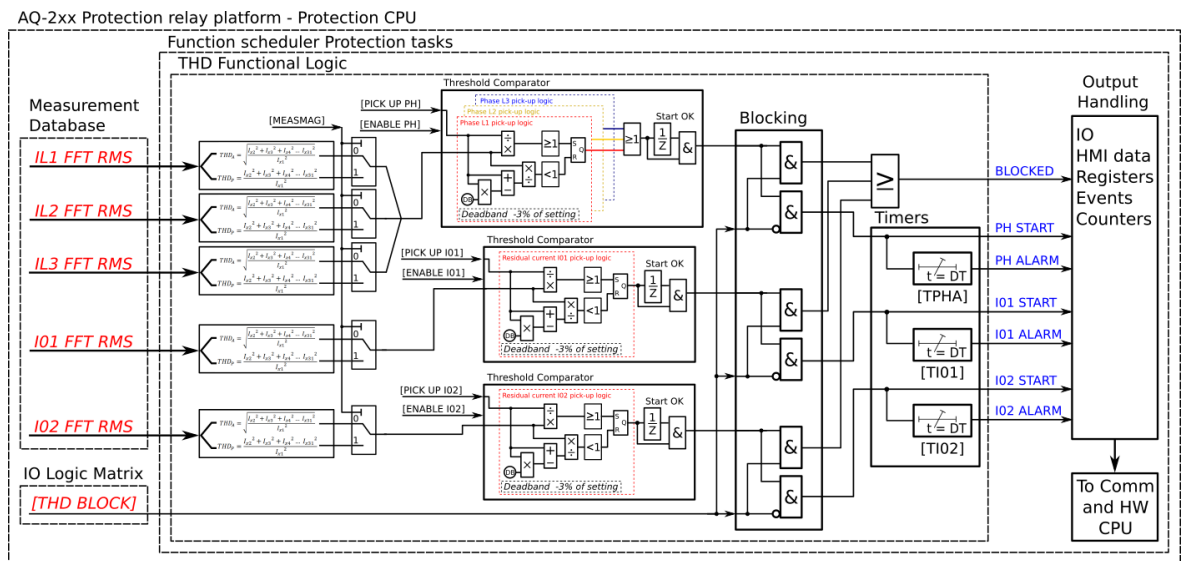

, where
I = measured current,
x= measurement input,
n = harmonic number

$$THD_A = \sqrt{\frac{I_{x2}^2 + I_{x3}^2 + I_{x4}^2 \dots I_{x31}^2}{I_{x1}^2}}$$

, where
I = measured current,
x= measurement input,
n = harmonic number

While both of these formulas exist, the power ratio (THD_P) is recognized by the IEEE, and the amplitude ratio (THD_A) is recognized by the IEC.

Figure. 4.6.3 - 165. Simplified function block diagram of the total harmonic distortion monitor function.

Measured input

The function block uses phase and residual current measurement channels. The function always uses FFT measurement of the whole harmonic spectrum of 32 components from each measured current channel. From these measurements the function calculates either the amplitude ratio or the power ratio.

Table. 4.6.3 - 167. Measurement inputs of the total harmonic distortion monitor function.

Signal	Description	Time base
$I_{L1}FFT$	FFT measurement of phase L1 (A) current	5ms
$I_{L2}FFT$	FFT measurement of phase L2 (B) current	5ms
$I_{L3}FFT$	FFT measurement of phase L3 (C) current	5ms
$I_{O1}FFT$	FFT measurement of residual IO1 current	5ms
$I_{O2}FFT$	FFT measurement of residual IO2 current	5ms

The selection of the calculation method is made with a setting parameter (common for all measurement channels).

General settings

The following general settings define the general behavior of the function. These settings are static i.e. it is not possible to change them by editing the setting group.

Table. 4.6.3 - 168. General settings.

Name	Range	Default	Description
THD> in side	<ul style="list-style-type: none"> CT1 CT2 	CT1	Defines which current measurement module the function uses.

Name	Range	Default	Description
Measurement magnitude	<ul style="list-style-type: none"> Amplitude Power 	Amplitude	Defines which available measured magnitude the function uses.

Pick-up settings

The *PhaseTHD*, *I01THD* and *I02THD* setting parameters control the pick-up and activation of the function. They define the maximum allowed measured current THD before action from the function. Before the function activates alarm signals, their corresponding pick-up elements need to be activated with the setting parameters *Enable phase THD alarm*, *Enable I01 THD alarm* and *Enable I02 THD alarm*. The function constantly calculates the ratio between the setting values and the calculated THD for each of the three phases. The reset ratio of 97 % is built into the function and is always relative to the setting value. The setting value is common for all measured phases. When the calculated THD exceeds the pick-up value (in single, dual or all phases), it triggers the pick-up operation of the function.

Setting group selection controls the operating characteristics of the function, i.e. the user or user-defined logic can change function parameters while the function is running.

Table. 4.6.3 - 169. Pick-up settings.

Name	Range	Step	Default	Description
Enable phase THD alarm	<ul style="list-style-type: none"> Enabled Disabled 	-	Enabled	Enables and disables the THD alarm function from phase currents.
Enable I01 THD alarm	<ul style="list-style-type: none"> Enabled Disabled 	-	Enabled	Enables and disables the THD alarm function from residual current input I01.
Enable I02 THD alarm	<ul style="list-style-type: none"> Enabled Disabled 	-	Enabled	Enables and disables the THD alarm function from residual current input I02.
Phase THD pick-up	0.10...100.00%	0.01%	10.00%	The pick-up setting for the THD alarm element from the phase currents. At least one of the phases' measured THD value has to exceed this setting in order for the alarm signal to activate.
I01 THD pick-up	0.10...100.00%	0.01%	10.00%	The pick-up setting for the THD alarm element from the residual current I01. The measured THD value has to exceed this setting in order for the alarm signal to activate.
I02 THD pick-up	0.10...100.00%	0.01%	10.00%	The pick-up setting for the THD alarm element from the residual current I02. The measured THD value has to exceed this setting in order for the alarm signal to activate.

Read-only parameters

The function's *Info* page displays useful, real-time information on the state of the protection function. It is accessed either through the device's HMI display, or through the setting tool software when it is connected to the device and its Live Edit mode is active.

Table. 4.6.3 - 170. Information displayed by the function.

Name	Range	Description
THD condition	<ul style="list-style-type: none"> • Normal • Start • Alarm • Blocked 	Displays status of the monitoring function.

Function blocking

The block signal is checked in the beginning of each program cycle. The blocking signal is received from the blocking matrix in the function's dedicated input. If the blocking signal is not activated when the pick-up element activates, a START signal is generated and the function proceeds to the time characteristics calculation.

If the blocking signal is active when the pick-up element activates, a BLOCKED signal is generated and the function does not process the situation further. If the START function has been activated before the blocking signal, it resets and the release time characteristics are processed similarly to when the pick-up signal is reset.

The variables the user can set are binary signals from the system. The blocking signal needs to reach the device minimum of 5 ms before the set operating delay has passed in order for the blocking to activate in time.

Operating time characteristics for activation and reset

This function supports definite time delay (DT). The following table presents the setting parameters for the function's time characteristics.

Table. 4.6.3 - 171. Settings for operating time characteristics.

Name	Range	Step	Default	Description
Phase THD alarm delay	0.000...1800.000s	0.005s	10.000s	Defines the delay for the alarm timer from the phase currents' measured THD.
I01 THD alarm delay	0.000...1800.000s	0.005s	10.000s	Defines the delay for the alarm timer from the residual current I01's measured THD.
I02 THD alarm delay	0.000...1800.000s	0.005s	10.000s	Defines the delay for the alarm timer from the residual current I02's measured THD.

Events and registers

The total harmonic distortion monitor function (abbreviated "THD" in event block names) generates events and registers from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

The function's outputs can be used for direct I/O controlling and user logic programming. The function also provides a resettable cumulative counter for the START, ALARM and BLOCKED events.

Table. 4.6.3 - 172. Event messages.

Event block name	Event names
THD1	THD Start Phase ON
THD1	THD Start Phase OFF
THD1	THD Start I01 ON
THD1	THD Start I01 OFF
THD1	THD Start I02 ON
THD1	THD Start I02 OFF
THD1	THD Alarm Phase ON
THD1	THD Alarm Phase OFF
THD1	THD Alarm I01 ON
THD1	THD Alarm I01 OFF
THD1	THD Alarm I02 ON
THD1	THD Alarm I02 OFF
THD1	Blocked ON
THD1	Blocked OFF

The function registers its operation into the last twelve (12) time-stamped registers. The register of the function records the ON event process data for START, ALARM and BLOCKED. The table below presents the structure of the function's register content.

Table. 4.6.3 - 173. Register content.

Register	Description
Date and time	dd.mm.yyyy hh:mm:ss.mss
Event	Event name
L1h, L2h, L3h Fault THD	Start/Alarm THD of each phase.
Setting group in use	Setting group 1...8 active.

4.6.4 Disturbance recorder (DR)

The disturbance recorder is a high-capacity (64 MB permanent flash memory) and fully digital recorder integrated to the protection relay. The maximum sample rate of the recorder's analog channels is 64 samples per cycle. The recorder also supports 95 digital channels simultaneously with the twenty (20) measured analog channels. Maximum capacity of recordings is 100.

The recorder provides a great tool to analyze the performance of the power system during network disturbance situations. The recorder's output is in general COMTRADE format and it is compatible with most viewers and injection devices. The files are based on the IEEE standard C37.111-1999. Captured recordings can be injected as playback with secondary testing tools that support the COMTRADE file format. Playback of files might help to analyze the fault, or can be simply used for educational purposes.

Analog and digital recording channels

Up to 20 analog recording channels and 95 digital channels are supported.

Table. 4.6.4 - 174. Analog recording channels.

Signal	Description
IL1	Phase current I_{L1}
IL2	Phase current I_{L2}
IL3	Phase current I_{L3}
I01c	Residual current I_{01} coarse*

ISup_3	Current measurement module voltage supply supervision (CT card 3)
UL1(2)VT2	Line-to-neutral U_{L1} or line-to-line voltage U_{L12} (VT card 2)
UL2(3)VT2	Line-to-neutral U_{L2} or line-to-line voltage U_{L23} (VT card 2)
UL3(1)VT2	Line-to-neutral U_{L3} or line-to-line voltage U_{L31} (VT card 2)
U0(SS)VT2	Zero sequence voltage U_0 or synchrocheck voltage U_{ss} (VT card 2)
USup_2	Voltage measurement module voltage supply supervision (VT card 2)

***NOTE:** There are two signals for each residual current channel in the disturbance recorder: coarse and fine. A coarse signal is capable of sampling in the full range of the current channel but suffers a loss of accuracy at very low currents. A fine signal is capable of sampling at very low currents and with high accuracy but cuts off at higher currents. Table below lists performance of both channels with fine and coarse gain.

Table. 4.6.4 - 175. Residual current channel performance with coarse or residual gain.

Channel	Coarse gain range	Fine gain range	Fine gain peak
I01	0...150 A	0...10 A	15 A
I02	0...75 A	0...5 A	8 A

Table. 4.6.4 - 176. Digital recording channels – Measurements.

MBIO ModA Ch x Invalid	Channel 1...8 of MBIO Mod A is invalid	Logical Output x	Logical output 1...64
MBIO ModB Ch x Invalid	Channel 1...8 of MBIO Mod B is invalid	NTP sync alarm	If NTP time synchronization is lost, this signal will be active.
MBIO ModB Ch x Invalid	Channel 1...8 of MBIO Mod C is invalid	Ph.Rotating Logic control 0=A-B-C, 1=A-C-B	Phase rotating order at the moment. If true ("1") the phase order is reversed.

**NOTICE!**

Digital channels are measured every 5 ms.

Recording settings and triggering

Disturbance recorder can be triggered manually or automatically by using the dedicated triggers. Every signal listed in "Digital recording channels" can be selected to trigger the recorder.

The device has a maximum limit of 100 for the number of recordings. Even when the recordings are very small, their number cannot exceed 100. The number of analog and digital channels together with the sample rate and the time setting affect the recording size. See calculation examples below in the section titled "Estimating the maximum length of total recording time".

Table. 4.6.4 - 178. Recorder control settings.

Name	Range	Description
Recorder enabled	<ul style="list-style-type: none"> Enabled Disabled 	Enables and disables the disturbance recorder function.

Name	Range	Description
Recorder status	<ul style="list-style-type: none"> Recorder ready Recording triggered Recording and storing Storing recording Recorder full Wrong config 	Indicates the status of recorder.
Clear record+	0...2 ³² -1	Clears selected recording. If "1" is inserted, first recording will be cleared from memory. If "10" is inserted, tenth (10th) recording will be cleared from memory.
Manual trigger	<ul style="list-style-type: none"> - Trig 	Triggers disturbance recording manually. This parameter will return back to "-" automatically.
Clear all records	<ul style="list-style-type: none"> - Clear 	Clears all disturbance recordings.
Clear newest record	<ul style="list-style-type: none"> - Clear 	Clears the newest stored disturbance recording.
Clear oldest record	<ul style="list-style-type: none"> - Clear 	Clears the oldest stored disturbance recording.
Max. number of recordings	0...100	Displays the maximum number of recordings that can be stored in the device's memory with settings currently in use. The maximum number of recordings can go up to 100.
Max. length of a recording	0.000...1800.000s	Displays the maximum length of a single recording.
Max. location of the pre-trigger	0.000...1800.000s	Displays the highest pre-triggering time that can be set with the settings currently in use.
Recordings in memory	0...100	Displays how many recordings are stored in the memory.

Table. 4.6.4 - 179. Recorder trigger setting.

Name	Description
Recorder trigger	Selects the trigger input(s). Clicking the "Edit" button brings up a pop-up window, and checking the boxes enable the selected triggers.

Table. 4.6.4 - 180. Recorder settings.

Name	Range	Default	Description
Recording length	0.100...1800.000s	1s	Sets the length of a recording.

Name	Range	Default	Description
Recording mode	<ul style="list-style-type: none"> FIFO Keep olds 	FIFO	Selects what happens when the memory is full. "FIFO" (= first in, first out) replaces the oldest stored recording with the latest one. "Keep olds" does not accept new recordings.
Analog channel samples	<ul style="list-style-type: none"> 64s/c 32s/c 16s/c 8s/c 	64s/c	Selects the sample rate of the disturbance recorder in samples per cycle. The samples are saved from the measured wave according to this setting.
Digital channel samples	5ms (fixed)	5 ms(fixed)	The fixed sample rate of the recorded digital channels.
Pretriggering time	0.2...15.0s	0.2s	Sets the recording length before the trigger.
Analog recording CH1...CH20	0...8 freely selectable channels	-	Selects the analog channel for recording. Please see the list of all available analog channels in the section titled "Analog and digital recording channels".
Automatically get recordings	<ul style="list-style-type: none"> Disabled Enabled 	Disabled	<p>Enables and disables the automatic transfer of recordings. The recordings are taken from the device's protection CPU and transferred to the device's FTP directory in the communication CPU; the FTP client then automatically loads the recordings from the device and transfers them further to the SCADA system.</p> <p>Please note that when this setting is enabled, all new disturbance recordings will be pushed to the FTP server of the device. Up to six (6) recordings can be stored in the FTP at once. Once those six recordings have been retrieved and removed, more recordings will then be pushed to the FTP. When a recording has been sent to the FTP server of the device, it is no longer accessible through setting tools <i>Disturbance recorder</i> → <i>Get DR files</i> command.</p>
Recorder digital channels	0...95 freely selectable channels	-	Selects the digital channel for recording. Please see the list of all available digital channels in the section titled "Analog and digital recording channels".

**NOTICE!**

The disturbance recorder is not ready unless the "Max. length of a recording" parameter is showing some value other than zero. At least one trigger input has to be selected in the "Recorder Trigger" setting to fulfill this term.

Estimating the maximum length of total recording time

Once the disturbance recorder's settings have been made and loaded to the device, the device automatically calculates and displays the total length of recordings. However, if the user wishes to confirm this calculation, they can do so with the following formula. Please note that the formula assumes there are no other files in the FTP that share the 64 MB space.

$$\frac{\text{Total sample reserve}}{(f_n * (Ch_{an} + 1) * SR) + (200 \text{ Hz} * Ch_{dig})}$$

Where:

- total sample reserve = the number of samples available in the FTP when no other files are saved; calculated by dividing the total number of available bytes by 4 bytes (=the size of one sample); e.g. 64 306 588 bytes/4 bytes = 16 076 647 samples.
- f_n = the nominal frequency (Hz).
- Ch_{an} = the number of analog channels recorded; "+ 1" stands for the time stamp for each recorded sample.
- SR = the selected sample rate (s/c).
- 200 Hz = the rate at which digital channels are always recorded, i.e. 5 ms.
- Ch_{dig} = the number of digital channels recorded.

For example, let us say the nominal frequency is 50 Hz, the selected sample rate is 64 s/c, nine (9) analog channels and two (2) digital channels record. The calculation is as follows:

$$\frac{16\,076\,647 \text{ samples}}{(50 \text{ Hz} * (9 + 1) * 64) + (200 \text{ Hz} * 2)} \approx 496 \text{ s}$$

Therefore, the maximum recording length in our example is approximately 496 seconds.

Application example

This chapter presents an application example of how to set the disturbance recorder and analyze its output. The recorder is configured by using the setting tool software or device HMI, and the results are analyzed with the AQviewer software (is automatically downloaded and installed with AQtivate). Registered users can download the latest tools from the Arcteq website (arcteq.fi/downloads/).

In this example, we want the recordings to be made according to the following specifications:

- the recording length is 6.0 s
- the sample rate is 64 s/c (therefore, with a 50 Hz system frequency a sample is taken every 312.5 μ s)
- the analog channels 1...8 are used
- digital channels are tracked every 5 ms
- the first activation of the overcurrent stage trip ($I > TRIP$) triggers the recorder
- the pre-triggering time is 5 (ie. how long is recorded before the $I > TRIP$ signal) and the post-triggering time is 1 s

The image below shows how these settings are placed in the setting tool.

Figure. 4.6.4 - 166. Disturbance recorder settings.

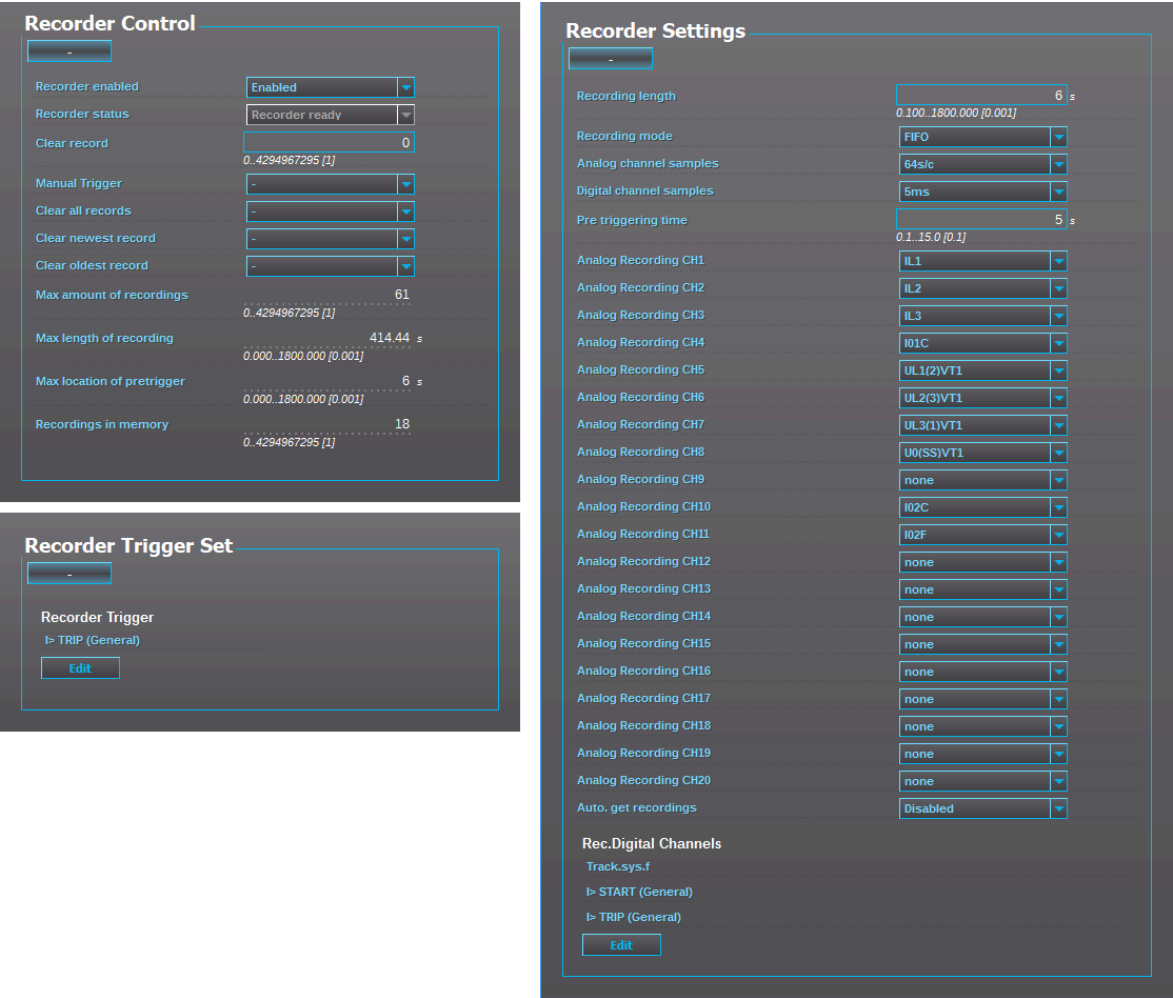

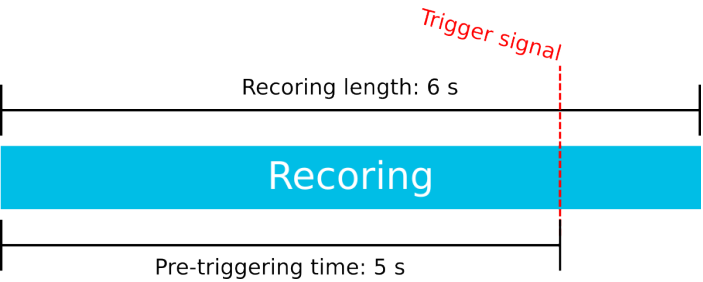

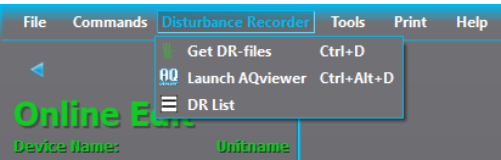

Figure. 4.6.4 - 167. Effects of recording length and pre-triggering time signals. This example is based on the settings shown above.

When there is at least one recording in the device's memory, that recording can be analyzed by using the AQviewer software (see the image below). However, the recording must first be made accessible to AQviewer. The user can read it from the device's memory (*Disturbance recorder* → *Get DR-files*). Alternatively, the user can load the recordings individually (*Disturbance recorder* → *DR List*) from a folder in the PC's hard disk drive; the exact location of the folder is described in *Tools* → *Settings* → *DR path*.

The user can also launch the AQviewer software from the *Disturbance recorder* menu. AQviewer software instructions can be found in AQtivate 200 Instruction manual (arcteq.fi/downloads/).

Events

The disturbance recorder function (abbreviated "DR" in event block names) generates events and registers from the status changes in the events listed below. Events cannot be masked off. The events triggered by the function are recorded with a time stamp.

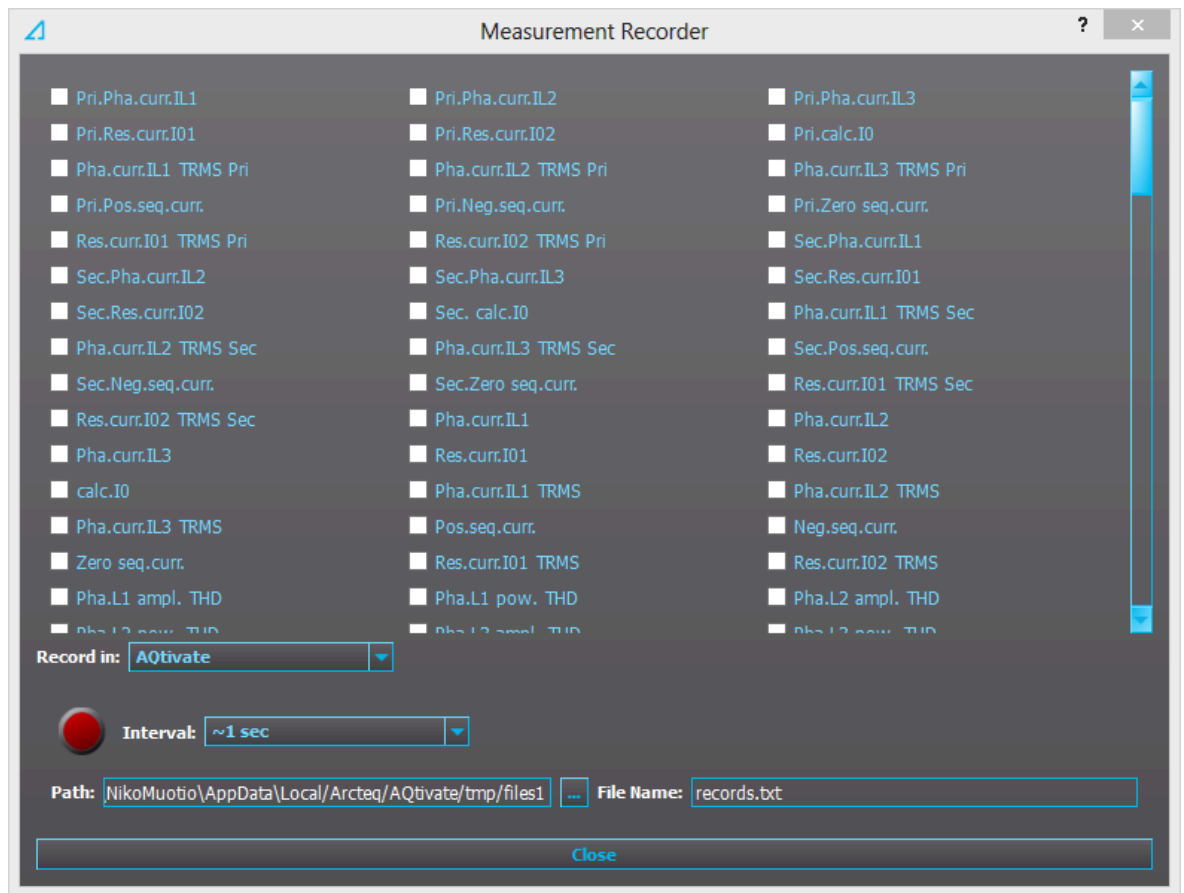

Table. 4.6.4 - 181. Event messages.

Event block name	Event names
DR1	Recorder triggered ON
DR1	Recorder triggered OFF
DR1	Recorder memory cleared
DR1	Oldest record cleared
DR1	Recorder memory full ON
DR1	Recorder memory full OFF
DR1	Recording ON
DR1	Recording OFF
DR1	Storing recording ON
DR1	Storing recording OFF
DR1	Newest record cleared

4.6.5 Event logger

Event logger records status changes of protection functions, digital inputs, logical signals etc. Events are recorded with a timestamp. The time stamp resolution is 1 ms. Up to 15 000 events can be stored at once. When 15 000 events have been recorded, the event history will begin to remove the oldest events to make room for new events. You can find more information about event masks in the selected function's "Events" tab. Event masks determine what is recorded into the event history; they are configured in each function's individual settings in the *Protection, Control and Monitoring* menu. Event history is accessible with PC setting tool (*Tools → Events and Logs → Event history*) and from the device HMI if "Events" view has been configured with Carousel designer in PC setting tool.

4.6.6 Measurement recorder

Measurements can be recorded to a file with the measurement recorder. The chosen measurements are recorded at selected intervals. In the "Measurement recorder" window, the measurements the user wants to be recorded can be selected by checking their respective check boxes. In order for the measurement recorder to activate, a connection to a device must be established via the setting tool software and its Live Edit mode must be enabled (see the AQtivate 200 manual for more information). Navigate to the measurement recorder through *Tools → Miscellaneous tools → Measurement recorder*. The recording interval can be changed from the "Interval" drop-down menu. From the "Record in" drop-down menu the user can also choose whether the measurements are recorded in the setting tool or in the device.

If the recording is done in the setting tool, both the setting tool software and its Live Edit mode have to be activated. The user can change the recording file location by editing the "Path" field. File names can also be changed with the "File name" field. Hitting the "Record" button (the big red circle) starts the recorder. Please note that closing the "Measurement recorder" window does not stop the recording; that can only be done by hitting the "Stop" button (the big blue circle).

If the recording is done in the device, only the recording interval needs to be set before recording can be started. The setting tool estimates the maximum recording time, which depends on the recording interval. When the measurement recorder is running, the measurements can be viewed in graph form with the AQtivate PRO software (see the image below).

Figure. 4.6.6 - 168. Measurement recorder values viewed with AQtivate PRO.

4.6.7 Measurement value recorder

The measurement value recorder function records the value of the selected magnitudes at the time of a pre-defined trigger signal. A typical application is the recording of fault currents or voltages at the time of the breaker trips; it can also be used to record the values from any trigger signal set by the user. The user can select whether the function records per-unit values or primary values. Additionally, the user can set the function to record overcurrent fault types or voltage fault types. The function operates instantly from the trigger signal.

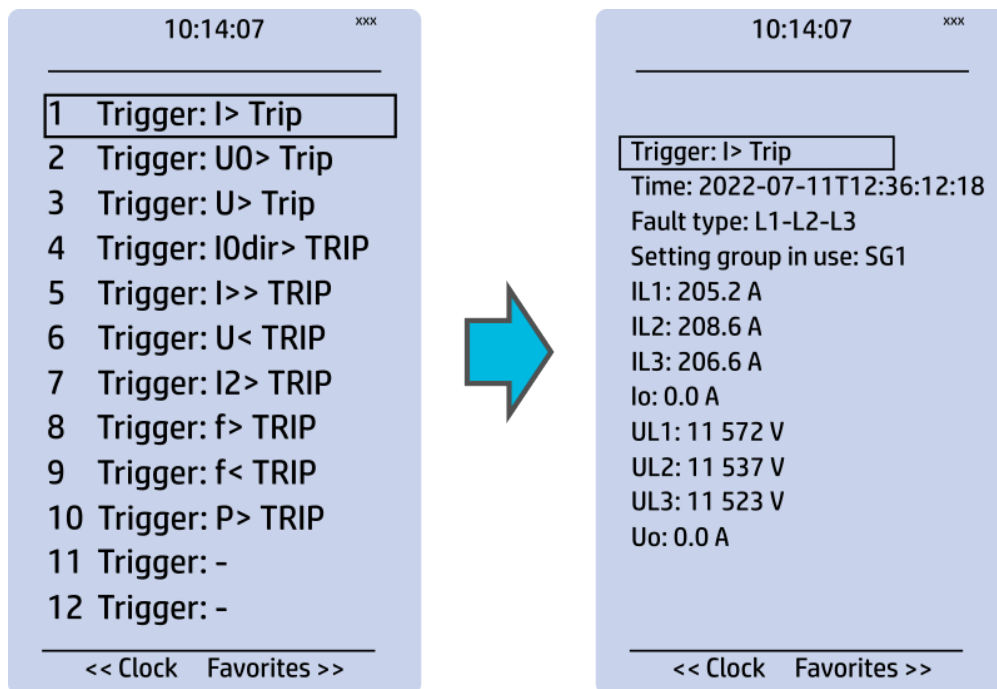

The measurement value recorder function has an integrated fault display which shows the current fault values when the tripped by one of the following functions:

- I> (non-directional overcurrent)
- I2> (current unbalance)
- Idir> (directional overcurrent)
- IO> (non-directional earth fault)
- IOdir> (directional earth fault)
- f<(underfrequency)
- f> (overfrequency)
- U< (undervoltage)
- U> (overvoltage)
- U1/U2 >/< (sequence voltage)
- U0> (residual voltage)
- P> (over power)
- P< (under power)
- Prev> (reverse power)
- T> (thermal overload)

When any of these functions trip, the fault values and the fault type are displayed in the Mimic view. The view can be enabled by activating the "VREC Trigger on" setting (*Tools → Events and logs → Set alarm events*). The resetting of the fault values is done by the input selected in the *General* menu.

Function keeps 12 latest recordings in memory. Recordings can be viewed in the HMI if "Fault registers" view has been added with "Carousel designer" tool.

Figure. 4.6.7 - 169. 12 latest recordings can be accessed from HMI if "Fault registers" view has been enabled in "Carousel designer" tool.

Measured input

The function block uses analog current and voltage measurement values. Based on these values, the device calculates the primary and secondary values of currents, voltages, powers, and impedances as well as other values.

The user can set up to eight (8) magnitudes to be recorded when the function is triggered. An overcurrent fault type, a voltage fault type, and a tripped stage can be recorded and reported straight to SCADA.

NOTICE!

The available measurement values depend on the device type. If only current analog measurements are available, the recorder can solely use signals which only use current. The same applies, if only voltage analog measurements are available.

Currents	Description
IL1 (ff), IL2 (ff), IL3 (ff), I01 (ff), I02 (ff)	The fundamental frequency current measurement values (RMS) of phase currents and of residual currents.
IL1TRMS, IL2TRMS, IL3TRMS, I01TRMS, I02TRMS	The TRMS current measurement values of phase currents and of residual currents.
IL1,2,3 & I01/I02 2 nd h., 3 rd h., 4 th h., 5 th h., 7 th h., 9 th h., 11 th h., 13 th h., 15 th h., 17 th h., 19 th h.	The magnitudes of phase current components: Fundamental, 2 nd harmonic, 3 rd harmonic, 4 th harmonic, 5 th harmonic 7 th , harmonic 9 th , harmonic 11 th , harmonic 13 th , harmonic 15 th , harmonic 17 th , harmonic 19 th harmonic current.
I1, I2, I0Z	The positive sequence current, the negative sequence current and the zero sequence current.
I0CalcMag	The residual current calculated from phase currents.

Currents	Description
IL1Ang, IL2Ang, IL3Ang, I01Ang, I02Ang, I0CalcAng, I1Ang, I2Ang	The angles of each measured current.
Voltages	Description
UL1Mag, UL2Mag, UL3Mag, UL12Mag, UL23Mag, UL31Mag U0Mag, U0CalcMag	The magnitudes of phase voltages, of phase-to-phase voltages, and of residual voltages.
U1 Pos.seq V mag, U2 Neg.seq V mag	The positive sequence voltage and the negative sequence voltage.
UL1Ang, UL2Ang, UL3Ang, UL12Ang, UL23Ang, UL31Ang U0Ang, U0CalcAng	The angles of phase voltages, of phase-to-phase voltages, and of residual voltages.
U1 Pos.seq V Ang, U2 Neg.seq V Ang	The positive sequence angle and the negative sequence angle.
Powers	Description
S3PH, P3PH, Q3PH	The three-phase apparent, active and reactive powers.
SL1, SL2, SL3, PL1, PL2, PL3, QL1, QL2, QL3	The phase apparent, active and reactive powers.
tanfi3PH, tanfiL1, tanfiL2, tanfiL3	The tan (φ) of three-phase powers and phase powers.
cosfi3PH, cosfiL1, cosfiL2, cosfiL3	The cos (φ) of three-phase powers and phase powers.
Impedances and admittances	Description
RL12, RL23, RL31 XL12, XL23, XL31, RL1, RL2, RL3 XL1, XL2, XL3 Z12, Z23, Z31 ZL1, ZL2, ZL3	The phase-to-phase and phase-to-neutral resistances, reactances and impedances.
Z12Ang, Z23Ang, Z31Ang, ZL1Ang, ZL2Ang, ZL3Ang	The phase-to-phase and phase-to-neutral impedance angles.
Rseq, Xseq, Zseq RseqAng, XseqAng, ZseqAng	The positive sequence resistance, reactance and impedance values and angles.
GL1, GL2, GL3, G0 BL1, BL2, BL3, B0 YL1, YL2, YL3, Y0	The conductances, susceptances and admittances.
YL1angle, YL2angle, YL3angle Y0angle	The admittance angles.
Others	Description
System f.	The tracking frequency in use at that moment.
Ref f1	The reference frequency 1.

Currents	Description
Ref f2	The reference frequency 2.
M thermal T	The motor thermal temperature.
F thermal T	The feeder thermal temperature.
T thermal T	The transformer thermal temperature.
RTD meas 1...16	The RTD measurement channels 1...16.
Ext RTD meas 1...8	The external RTD measurement channels 1...8 (ADAM module).

Reported values

When triggered, the function holds the recorded values of up to eight channels, as set. In addition to this tripped stage, the overcurrent fault type and the voltage fault types are reported to SCADA.

Table. 4.6.7 - 183. Reported values.

Name	Range	Description
Tripped stage	<ul style="list-style-type: none"> • - • I> Trip • I>> Trip • I>>> Trip • I>>>> Trip • IDir> Trip • IDir>> Trip • IDir>>> Trip • IDir>>>> Trip • U> Trip • U>> Trip • U>>> Trip • U>>>> Trip • U< Trip • U<< Trip • U<<< Trip • U<<<< Trip • IO> TRIP • IO>> Trip • IO>>> Trip • IO>>>> Trip • IODir> Trip • IODir>> Trip • IODir>>> Trip • IODir>>>> Trip • f> Trip • f>> Trip • f>>> Trip • f>>>> Trip • f< Trip • f<< Trip • f<<< Trip • f<<<< Trip • P> Trip • P< Trip • Prev> Trip • T> Trip • I2> Trip • I2>> Trip • I2>>> Trip • I2>>>> Trip • U1/2 > Trip • U1/2 >> Trip • U1/2 >>> Trip • U1/2 >>>> Trip • U0> Trip • U0>> Trip • U0>>> Trip • U0>>>> Trip 	The tripped stage.
Overcurrent fault type	<ul style="list-style-type: none"> • A-G • B-G • A-B • C-G • A-C • B-C • A-B-C 	The overcurrent fault type.

Name	Range	Description
Voltage fault type	<ul style="list-style-type: none"> • A(AB) • B(BC) • A-B(AB-BC) • C(CA) • A-C(AB-CA) • B-C(BC-CA) • A-B-C • Overfrequency • Underfrequency • Overpower • Underpower • Reversepower • Thermal overload • Unbalance • Harmonic overcurrent • Residual overvoltage 	The voltage fault type.
Magnitude 1...8	0.000...1800.000 A/V/p.u.	The recorded value in one of the eight channels.

Events

The measurement value recorder function (abbreviated "VREC" in event block names) generates events from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

Table. 4.6.7 - 184. Event messages.

Event block name	Event name
VREC1	Recorder triggered ON
VREC1	Recorder triggered OFF

4.6.8 Running hour counter

The running hour counter (abbreviated "RHC" in event block names) is capable of counting the running time of a motor, a generator, or a similar application.

The counter value can be added to the mimic view and read to SCADA.

Table. 4.6.8 - 185. Parameter descriptions

Name	Range	Description
Activate counter input	Any binary input	Counter runs whenever input set here is active.
Running hours	hh:mm:ss	Indicates running hours counted so far. This value can be edited by the user. The user input must be set in seconds, which is then converted by the device to hours, minutes and seconds (hh:mm:ss).

Name	Range	Description
Start count	0...4294967295 Starts	Start counter.
Clear hours	<ul style="list-style-type: none"> - Clear 	Clears "Running hours" and "Start count".

The function (abbreviated "RHC" in event block names) generates events from the status changes in the events listed below. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp.

Table. 4.6.8 - 186. Event messages.

Event block name	Event name
RHC1	Running hour counter ON
RHC1	Running hour counter OFF
RHC1	Running hour counter cleared ON
RHC1	Running hour counter cleared OFF

5 Communication

5.1 Connections menu

"Connections" menu is found under "Communication" menu. It contains all basic settings of ethernet port and RS-485 serial port included with every AQ-200 device as well as settings of communication option cards.

Table. 5.1 - 187. Ethernet settings.

Name	Range	Description
IP address	0.0.0.0...255.255.255.255	Set IP address of the ethernet port in the back of the AQ-200 series device.
Netmask	0.0.0.0...255.255.255.255	Set netmask of the ethernet port in the back of the AQ-200 series device.
Gateway	0.0.0.0...255.255.255.255	Set gateway of the ethernet port in the back of the AQ-200 series device.
MAC-Address	00-00-00-00-00-00...FF-FF-FF-FF-FF-FF	Indication of MAC address of the AQ-200 series device.
Storm Protection	<ul style="list-style-type: none"> Disable Enable 	When enabled, the Storm protection functionality of the internal switch in the device is enabled. This functionality aims to protect the device from excess ethernet traffic caused by storm situation. When enabled, the packet rate allowed to pass through on the ingress port towards the device, is limited to 150 packets per second. Multicast packets are also included in the packet limit.
Double Ethernet card mode	<ul style="list-style-type: none"> Switch HSR PRP 	If the device has a double ethernet option card it is possible to choose its mode.
COM A and Ethernet option card connection	<ul style="list-style-type: none"> Block all Allow both directions Allow COM A to option card Allow option card to COM A 	If the device has ethernet option card it is possible to determine the allowed direction of data.
Double Ethernet link events	<ul style="list-style-type: none"> Disable Enable 	Disables or enables "Double Ethernet Link A down" and "Double Ethernet Link B down" logic signals and events.
Double Ethernet PRP ports	<ul style="list-style-type: none"> AB BA 	LanA and LanB port assignment for communication cards that support PRP.

Virtual Ethernet enables the device to be connected to multiple different networks simultaneously via one physical Ethernet connection. Virtual Ethernet has its own separate IP address and network configurations. All Ethernet-based protocol servers listen for client connections on the IP addresses of both the physical Ethernet and the Virtual Ethernet.

Table. 5.1 - 188. Virtual Ethernet settings.

Name	Description
Enable virtual adapter (No / Yes)	Enable virtual adapter. Off by default.
IP address	Set IP address of the virtual adapter.
Netmask	Set netmask of the virtual adapter.
Gateway	Set gateway of the virtual adapter.

AQ-200 series devices are always equipped with an RS-485 serial port. In the software it is identified as "Serial COM1" port.

Table. 5.1 - 189. Serial COM1 settings.

Name	Range	Description
Bitrate	<ul style="list-style-type: none"> 9600bps 19200bps 38400bps 	Bitrate used by RS-485 port.
Databits	7...8	Databits used by RS-485 port.
Parity	<ul style="list-style-type: none"> None Even Odd 	Paritybits used by RS-485 port.
Stopbits	1...2	Stopbits used by RS-485 port.
Protocol	<ul style="list-style-type: none"> None ModbusRTU ModbusIO IEC103 SPA DNP3 IEC101 	Communication protocol used by RS-485 port.

AQ-200 series supports communication option card type that has serial fiber ports (Serial COM2) and RS-232 port (Serial COM3).

Table. 5.1 - 190. Serial COM2 settings.

Name	Range	Description
Bitrate	<ul style="list-style-type: none"> 9600bps 19200bps 38400bps 	Bitrate used by serial fiber channels.
Databits	7...8	Databits used by serial fiber channels.
Parity	<ul style="list-style-type: none"> None Even Odd 	Paritybits used by serial fiber channels.
Stopbits	1...2	Stopbits used by serial fiber channels.

Name	Range	Description
Protocol	<ul style="list-style-type: none"> • None • ModbusRTU • ModbusIO • IEC103 • SPA • DNP3 • IEC101 	Communication protocol used by serial fiber channels.
Echo	<ul style="list-style-type: none"> • Off • On 	Enable or disable echo.
Idle Light	<ul style="list-style-type: none"> • Off • On 	Idle light behaviour.

Table. 5.1 - 191. Serial COM3 settings.

Name	Range	Description
Bitrate	<ul style="list-style-type: none"> • 9600bps • 19200bps • 38400bps 	Bitrate used by RS-232 port.
Databits	7...8	Databits used by RS-232 port.
Parity	<ul style="list-style-type: none"> • None • Even • Odd 	Paritybits used by RS-232 port.
Stopbits	1...2	Stopbits used by RS-232 port.
Protocol	<ul style="list-style-type: none"> • None • ModbusRTU • ModbusIO • IEC103 • SPA • DNP3 • IEC101 	Communication protocol used by RS-232 port.

5.2 Time synchronization

Time synchronization source can be selected with "Time synchronization" parameter in the "General" menu.

Table. 5.2 - 192. General time synchronization source settings.

Name	Range	Description
Time synchronization source	<ul style="list-style-type: none"> • Internal • External NTP • External serial • IRIG-B • 	Selection of time synchronization source.

5.2.1 Internal

If no external time synchronization source is available the mode should be set to "internal". This means that the AQ-200 device clock runs completely on its own. Time can be set to the device with AQtivate setting tool with *Commands* → *Sync Time* command or in the clock view from the HMI. When using *Sync time* command AQtivate sets the time to device the connected computer is currently using. Please note that the clock doesn't run when the device is powered off.

5.2.2 NTP

When enabled, the NTP (Network Time Protocol) service can use external time sources to synchronize the device's system time. The NTP client service uses an Ethernet connection to connect to the NTP time server. NTP can be enabled by setting the primary time server and the secondary time server parameters to the address of the system's NTP time source(s).

Table. 5.2.2 - 193. Server settings.

Name	Range	Description
Primary time server address	0.0.0.0...255.255.255.255	Defines the address of the primary NTP server. Setting this parameter at "0.0.0.0" means that the server is not in use.
Secondary time server address	0.0.0.0...255.255.255.255	Defines the address of the secondary (or backup) NTP server. Setting this parameter at "0.0.0.0" means that the server is not in use.

Table. 5.2.2 - 194. Client settings.

Name	Range	Description
IP address	0.0.0.0...255.255.255.255	Defines the address of the NTP client. NOTE: This address must be different than the general IP address of the device.
Netmask	0.0.0.0...255.255.255.255	Defines the client's netmask.
Gateway	0.0.0.0...255.255.255.255	Defines the client's gateway.
MAC address	00-00-00-00-00-00...FF-FF-FF-FF-FF-FF	Displays the MAC address of the client.
Network status	<ul style="list-style-type: none"> Running IP error NM error GW error 	Displays the status or possible errors of the NTP (client) settings.

Table. 5.2.2 - 195. Status.

Name	Range	Description
NTP quality for events	<ul style="list-style-type: none"> No sync Synchronized 	Displays the status of the NTP time synchronization at the moment. NOTE: This indication is not valid if another time synchronization method is used (external serial).

Name	Range	Description
NTP-processed message count	0...4294967295	Displays the number of messages processed by the NTP protocol.

**NOTICE!**

A unique IP address must be reserved for the NTP client. The device's IP address cannot be used.

Additionally, the time zone of the device can be set by connecting to the device and the selecting the time zone at *Commands* → *Set time zone* in AQtivate setting tool.

5.3 Communication protocols

The following chapters will describe all available communication protocols. The device includes an RJ-45 ethernet port and an RS-485 serial port, which are able to use communication protocols. See other options for communication ports under "[Construction and installation](#)".

**NOTICE!**

Only one communication protocol can be used at a time by an AQ-210 device!

5.3.1 IEC 61850

The user can enable the IEC 61850 protocol in device models that support this protocol at *Communication* → *Protocols* → *IEC61850*. AQ-21x frame units support Edition 1 of IEC 61850. AQ-25x frame units support both Edition 1 and 2 of IEC 61850. The following services are supported by IEC 61850 in Arcteq devices:

- Up to six data sets (predefined data sets can be edited with the IEC 61850 tool in AQtivate)
- Report Control Blocks (both buffered and unbuffered reporting)
- Control ('Direct operate with normal security', 'Select before operate with normal security', 'Direct with enhanced security' and 'Select before operate with enhanced security' control sequences)
- Disturbance recording file transfer
- GOOSE
- Time synchronization

The device's current IEC 61850 setup can be viewed and edited with the IEC61850 tool (*Tools* → *Communication* → *IEC 61850*).

Settings

The general setting parameters for the IEC 61850 protocol are visible both in AQtivate and in the local HMI. The settings are described in the table below.

Table. 5.3.1 - 196. General settings.

Name	Range	Step	Default	Description
Enable IEC 61850	<ul style="list-style-type: none"> • Disabled • Enabled 	-	Disabled	Enables and disables the IEC 61850 communication protocol.
Reconfigure IEC 61850	<ul style="list-style-type: none"> • - • Reconfigure 	-	-	Reconfigures IEC 61850 settings.

Name	Range	Step	Default	Description
IP port	0...65 535	1	102	Defines the IP port used by the IEC 61850 protocol. The standard (and default) port is 102.
Control Authority switch	<ul style="list-style-type: none"> Remote Control Station Level Control 	-	Remote Control	The device can be set to allow object control via IEC 61850 only from clients that are of category Station level control. This would mean that other Remote control clients would not be allowed to control. In Remote control mode all IEC 61850 clients of both remote and station level category are allowed to control objects.
Ethernet port	<ul style="list-style-type: none"> All COM A Double ethernet card 	-	All	Determines which ports use IEC61850. Parameter is visible if double ethernet option card is found in the device.
General deadband	0.1...10.0 %	0.1 %	2 %	Determines the general data reporting deadband settings.
Active energy deadband	0.1...1000.0 kWh	0.1 kWh	2 kWh	Determines the data reporting deadband settings for this measurement.
Reactive energy deadband	0.1...1000.0 kVar	0.1 kVar	2 kVar	Determines the data reporting deadband settings for this measurement.
Active power deadband	0.1...1000.0 kW	0.1 kW	2 kW	Determines the data reporting deadband settings for this measurement.
Reactive power deadband	0.1...1000.0 kVar	0.1 kVar	2 kVar	Determines the data reporting deadband settings for this measurement.
Apparent power deadband	0.1...1000.0 kVA	0.1 kVA	2 kVA	Determines the data reporting deadband settings for this measurement.
Power factor deadband	0.01...0.99	0.01	0.05	Determines the data reporting deadband settings for this measurement.
Frequency deadband	0.01...1.00 Hz	0.01 Hz	0.1 Hz	Determines the data reporting deadband settings for this measurement.
Current deadband	0.01...50.00 A	0.01 A	5 A	Determines the data reporting deadband settings for this measurement.
Residual current deadband	0.01...50.00 A	0.01 A	0.2 A	Determines the data reporting deadband settings for this measurement.
Voltage deadband	0.01...5000.00 V	0.01 V	200 V	Determines the data reporting deadband settings for this measurement.
Residual voltage deadband	0.01...5000.00 V	0.01 V	200 V	Determines the data reporting deadband settings for this measurement.
Angle measurement deadband	0.1...5.0 deg	0.1 deg	1 deg	Determines the data reporting deadband settings for this measurement.
Integration time	0...10 000 ms	1 ms	0 ms	Determines the integration time of the protocol. If this parameter is set to "0 ms", no integration time is in use.

Name	Range	Step	Default	Description
GOOSE Ethernet port	<ul style="list-style-type: none"> All COM A Double ethernet card 	-	All	Determines which ports can use GOOSE communication. Visible if double ethernet option card is found in the device.

For more information on the IEC 61850 communication protocol support, please refer to the conformance statement documents (www.arcteq.fi/downloads/ → AQ 200 series → Resources).

5.3.1.1 GOOSE

Arcteq devices support both GOOSE publisher and GOOSE subscriber. GOOSE subscriber is enabled with the "GOOSE subscriber enable" parameter at *Communication* → *Protocols* → *IEC 61850/GOOSE*. The GOOSE inputs are configured using either the local HMI or the AQtivate software.

There are up to 64 GOOSE inputs available for use. Each of the GOOSE inputs also has a corresponding input quality signal which can also be used in internal logic. The quality is good, when the input quality status is "low" (that is, when the quality is marked as "0"). The value of the input quality can switch on as a result of a GOOSE time-out or a configuration error, for example. The status and quality of the various logical input signals can be viewed at the *GOOSE IN status* and *GOOSE IN quality* tabs at *Control* → *Device I/O* → *Logical signals*.

GOOSE input settings

The table below presents the different settings available for all 64 GOOSE inputs.

These settings can be found from *Communication* → *Protocols* → *IEC61850*.

Table. 5.3.1.1 - 197. GOOSE input settings.

Name	Range	Description
In use	<ul style="list-style-type: none"> No (Default) Yes 	Enables and disables the GOOSE input in question.
Application ID ("AppID")	0x0...0x3FFF	Defines the application ID that will be matched with the publisher's GOOSE control block.
Configuration revision ("ConfRev")	1...2 ³² -1	Defines the configuration revision that will be matched with the publisher's GOOSE control block.
Data index ("DataIdx")	0...99	Defines the data index of the value in the matched published frame. It is the status of the GOOSE input.
NextIdx is quality	<ul style="list-style-type: none"> No (Default) Yes 	Selects whether or not the next received input is the quality bit of the GOOSE input.

GOOSE input descriptions

Each of the GOOSE inputs can be given a description. The user defined description are displayed in most of the menus:

- logic editor
- matrix
- block settings
-
-
- etc.

These settings can be found from *Control* → *Device IO* → *Logical Signals* → *GOOSE IN Description*.

Table. 5.3.1.1 - 198. GOOSE input user description.

Name	Range	Default	Description
User editable description GI x	1...31 characters	GOOSE IN x	Description of the GOOSE input. This description is used in several menu types for easier identification.

GOOSE events

GOOSE signals generate events from status changes. The user can select which event messages are stored in the main event buffer: ON, OFF, or both. The events triggered by the function are recorded with a time stamp and with process data values. The time stamp resolution is 1 ms.

Table. 5.3.1.1 - 199. GOOSE event

Event block name	Event name	Description
GOOSE1...GOOSE2	GOOSE IN 1...64 ON/OFF	Status change of GOOSE input.
GOOSE3...GOOSE4	GOOSE IN 1...64 quality Bad/Good	Status change of GOOSE inputs quality.

Setting the publisher

The configuration of the GOOSE publisher is done using the IEC 61850 tool in AQtivate (*Tools* → *Communication* → *IEC 61850*). Refer to *AQtivate-200 Instruction manual* for more information on how to set up GOOSE publisher.

5.3.2 Modbus TCP and Modbus RTU

The device supports both Modbus TCP and Modbus RTU communication. Modbus TCP uses the Ethernet connection to communicate with Modbus TCP clients. Modbus RTU is a serial protocol that can be selected for the available serial ports.

The user can enable the Modbus TCP protocol at *Communication* → *Protocols* → *Modbus TCP*. The user can enable the Modbus RTU protocol at *Communication* → *Connections*.

The following Modbus function types are supported:

- Read multiple holding registers (function code 3)
- Write single holding register (function code 6)
- Write multiple holding registers (function code 16)
- Read/Write multiple registers (function code 23)

The following data can be accessed using both Modbus TCP and Modbus RTU:

- Device measurements
- Device I/O

- Commands
- Events
- Time

Once the configuration file has been loaded, the user can access the Modbus map of the device via the AQtivate software (*Tools → Communication → Modbus Map*). Please note that holding registers start from 1. Some masters might begin numbering holding register from 0 instead of 1; this will cause an offset of 1 between the device and the master. Modbus map can be edited with Modbus Configurator (*Tools → Communication → Modbus Configurator*).

Table. 5.3.2 - 200. Modbus TCP settings.

Parameter	Range	Description
Enable Modbus TCP	<ul style="list-style-type: none"> • Disabled • Enabled 	Enables and disables the Modbus TCP on the Ethernet port.
IP port	0...65 535	Defines the IP port used by Modbus TCP. The standard port (and the default setting) is 502.
Event read mode	<ul style="list-style-type: none"> • Get oldest available • Continue previous connection • New events only 	Get oldest event possible (Default) Continue with the event idx from previous connection Get only new events from connection time and forward.

Table. 5.3.2 - 201. Modbus RTU settings.

Parameter	Range	Description
Slave address	1...247	Defines the Modbus RTU slave address for the unit.

Reading events

Modbus protocol does not support time-stamped events by standard definition. This means that every vendor must come up with their own definition how to transfer events from the device to the client. In AQ-200 series devices events can be read from HR17...HR22 holding registers. HR17 contains the event-code, HR18...20 contains the time-stamp in UTC, HR21 contains a sequential index and HR22 is reserved for future expansion. See the Modbus Map for more information. The event-codes and their meaning can be found from Event list (*Tools → Events and Logs → Event list* in setting tool). The event-code in HR17 is 0 if no new events can be found in the device event-buffer. Every time HR17 is read from client the event in event-buffer is consumed and on following read operation the next un-read event information can be found from event registers. HR11...HR16 registers contains a back-up of last read event. This is because some users want to double-check that no events were lost

5.3.3 IEC 103

IEC 103 is the shortened form of the international standard IEC 60870-5-103. The AQ 200 series units are able to run as a secondary (slave) station. The IEC 103 protocol can be selected for the serial ports that are available in the device. A primary (master) station can then communicate with the AQ-200 device and receive information by polling from the slave device. The transfer of disturbance recordings is not supported.

The user can enable the IEC 103 protocol at *Communication → Connections*.

NOTE: Once the configuration file has been loaded, the IEC 103 map of the device can be found in the AQtivate software (*Tools → IEC 103 map*).

Table. 5.3.3 - 202. IEC 103 settings.

Name	Range	Step	Default	Description
Slave address	1...254	1	1	Defines the IEC 103 slave address for the unit.
Measurement interval	0...60 000 ms	1 ms	2000 ms	Defines the interval for the measurements update.

The following table presents the setting parameters for the IEC 103 protocol.

5.3.4 IEC 101/104

The standards IEC 60870-5-101 and IEC 60870-5-104 are closely related. Both are derived from the IEC 60870-5 standard. On the physical layer the IEC 101 protocol uses serial communication whereas the IEC 104 protocol uses Ethernet communication. The IEC 101/104 implementation works as a slave in the unbalanced mode.

For detailed information please refer to the IEC 101/104 interoperability document (www.arcteq.fi/downloads/ → AQ-200 series → Resources → "AQ-200 IEC101 & IEC104 interoperability").

The user can enable the IEC104 protocol at *Communication* → *Protocols* → *IEC101/104*. The user can enable the IEC101 protocol at *Communication* → *Connections*.

IEC 101 settings

Table. 5.3.4 - 203. IEC 101 settings.

Name	Range	Step	Default	Description
Common address of ASDU	0...65 534	1	1	Defines the common address of the application service data unit (ASDU) for the IEC 101 communication protocol.
Common address of ASDU size	1...2	1	2	Defines the size of the common address of ASDU.
Link layer address	0...65 534	1	1	Defines the address for the link layer.
Link layer address size	1...2	1	2	Defines the address size of the link layer.
Information object address size	2...3	1	3	Defines the address size of the information object.
Cause of transmission size	1...2	1	2	Defines the cause of transmission size.

IEC 104 settings

Table. 5.3.4 - 204. IEC 104 settings.

Name	Range	Step	Default	Description
IEC 104 enable	<ul style="list-style-type: none"> Disabled Enabled 	-	Disabled	Enables and disables the IEC 104 communication protocol.
IP port	0...65 535	1	2404	Defines the IP port used by the protocol.
Common address of ASDU	0...65 534	1	1	Defines the common address of the application service data unit (ASDU) for the IEC 104 communication protocol.
APDU timeout (t1)	0...3600 s	1 s	0 s	The maximum amount of time the slave waits for a transmitted Application Protocol Data Unit (APDU) to be confirmed as received by the master.
Idle timeout (t3)	0...3600 s	1 s	0 s	The slave outstation can use a test frame to determine if the channel is still available after a prolonged period of communications inactivity. Test frame is sent at an interval specified here.

Measurement scaling coefficients

The measurement scaling coefficients are available for the following measurements, in addition to the general measurement scaling coefficient:

Table. 5.3.4 - 205. Measurements with scaling coefficient settings.

Name	Range
Active energy	<ul style="list-style-type: none"> No scaling 1/10 1/100 1/1000 1/10 000 1/100 000 1/1 000 000 10 100 1000 10 000 100 000 1 000 000
Reactive energy	
Active power	
Reactive power	
Apparent power	
Power factor	
Frequency	
Current	
Residual current	
Voltage	
Residual voltage	
Angle	

Deadband settings.

Table. 5.3.4 - 206. Analog change deadband settings.

Name	Range	Step	Default	Description
General deadband	0.1...10.0%	0.1%	2%	Determines the general data reporting deadband settings.
Active energy deadband	0.1...1000.0kWh	0.1kWh	2kWh	Determines the data reporting deadband settings for this measurement.
Reactive energy deadband	0.1...1000.0kVar	0.1kVar	2kVar	
Active power deadband	0.1...1000.0kW	0.1kW	2kW	
Reactive power deadband	0.1...1000.0kVar	0.1kVar	2kVar	
Apparent power deadband	0.1...1000.0kVA	0.1kVA	2kVA	
Power factor deadband	0.01...0.99	0.01	0.05	
Frequency deadband	0.01...1.00Hz	0.01Hz	0.1Hz	
Current deadband	0.01...50.00A	0.01A	5A	
Residual current deadband	0.01...50.00A	0.01A	0.2A	
Voltage deadband	0.01...5000.00V	0.01V	200V	
Residual voltage deadband	0.01...5000.00V	0.01V	200V	
Angle measurement deadband	0.1...5.0deg	0.1deg	1deg	
Integration time	0...10 000ms	1ms	-	Determines the integration time of the protocol. If this parameter is set to "0 ms", no integration time is in use.

5.3.5 SPA

The device can act as a SPA slave. SPA can be selected as the communication protocol for the RS-485 port (Serial COM1). When the device has a serial option card, the SPA protocol can also be selected as the communication protocol for the serial fiber (Serial COM2) ports or RS-232 (Serial COM3) port. Please refer to the chapter "[Construction and installation](#)" in the device manual to see the connections for these modules.

The data transfer rate of SPA is 9600 bps, but it can also be set to 19 200 bps or 38 400 bps. As a slave the device sends data on demand or by sequenced polling. The available data can be measurements, circuit breaker states, function starts, function trips, etc. The full SPA signal map can be found in AQtivate (*Tools* → *SPA map*).

The SPA event addresses can be found at *Tools* → *Events and logs* → *Event list*.

The user can enable the SPA protocol at *Communication* → *Connections*.

Table. 5.3.5 - 207. SPA setting parameters.

Name	Range	Description
SPA address	1...899	SPA slave address.
UTC time sync	<ul style="list-style-type: none"> Disabled Enabled 	Determines if UTC time is used when synchronizing time. When disabled it is assumed time synchronization uses local time. If enabled it is assumed that UTC time is used. When UTC time is used the timezone must be set at <i>Commands</i> → <i>Set time zone</i> .

**NOTICE!**

To access SPA map and event list, an .aqc configuration file should be downloaded from the device.

5.3.6 DNP3

DNP3 is a protocol standard which is controlled by the DNP Users Group (www.dnp.org). The implementation of a DNP3 slave is compliant with the DNP3 subset (level) 2, but it also contains some functionalities of the higher levels. For detailed information please refer to the DNP3 Device Profile document (www.arcteq.fi/downloads/ → AQ-200 series → Resources).

The user can enable the DNP3 TCP protocol at *Communication* → *Protocols* → *DNP3*. The user can enable the DNP3 serial protocol at *Communication* → *Connections*.

Settings

The following table describes the DNP3 setting parameters.

Table. 5.3.6 - 208. Settings.

Name	Range	Step	Default	Description
Enable DNP3 TCP	<ul style="list-style-type: none"> Disabled Enabled 	-	Disabled	Enables and disables the DNP3 TCP communication protocol when the Ethernet port is used for DNP3. If a serial port is used, the DNP3 protocol can be enabled from <i>Communication</i> → <i>DNP3</i> .
IP port	0...65 535	1	20 000	Defines the IP port used by the protocol.
Slave address	1...65 519	1	1	Defines the DNP3 slave address of the unit.
Master address	1...65 534	1	2	Defines the address for the allowed master.
Link layer time-out	0...60 000ms	1ms	0ms	Defines the length of the time-out for the link layer.
Link layer retries	1...20	1	1	Defines the number of retries for the link layer.
Diagnostic - Error counter	0...2 ³² -1	1	-	Counts the total number of errors in received and sent messages.

Name	Range	Step	Default	Description
Diagnostic - Transmitted messages	$0 \dots 2^{32} - 1$	1	-	Counts the total number of transmitted messages.
Diagnostic - Received messages	$0 \dots 2^{32} - 1$	1	-	Counts the total number of received messages.

Default variations

Table. 5.3.6 - 209. Default variations.

Name	Range	Default	Description
Group 1 variation (BI)	<ul style="list-style-type: none"> Var 1 Var 2 	Var 1	Selects the variation of the binary signal.
Group 2 variation (BI change)	<ul style="list-style-type: none"> Var 1 Var 2 	Var 2	Selects the variation of the binary signal change.
Group 3 variation (DBI)	<ul style="list-style-type: none"> Var 1 Var 2 	Var 1	Selects the variation of the double point signal.
Group 4 variation (DBI change)	<ul style="list-style-type: none"> Var 1 Var 2 	Var 2	Selects the variation of the double point signal.
Group 20 variation (CNTR)	<ul style="list-style-type: none"> Var 1 Var 2 Var 5 Var 6 	Var 1	Selects the variation of the control signal.
Group 22 variation (CNTR change)	<ul style="list-style-type: none"> Var 1 Var 2 Var 5 Var 6 	Var 5	Selects the variation of the control signal change.
Group 30 variation (AI)	<ul style="list-style-type: none"> Var 1 Var 2 Var 3 Var 4 Var 5 	Var 5	Selects the variation of the analog signal.
Group 32 variation (AI change)	<ul style="list-style-type: none"> Var 1 Var 2 Var 3 Var 4 Var 5 Var 7 	Var 5	Selects the variation of the analog signal change.

Setting the analog change deadbands

Table. 5.3.6 - 210. Analog change deadband settings.

Name	Range	Step	Default	Description
General deadband	0.1...10.0%	0.1%	2%	Determines the general data reporting deadband settings.
Active energy deadband	0.1...1000.0kWh	0.1kWh	2kWh	Determines the data reporting deadband settings for this measurement.
Reactive energy deadband	0.1...1000.0kVar	0.1kVar	2kVar	
Active power deadband	0.1...1000.0kW	0.1kW	2kW	
Reactive power deadband	0.1...1000.0kVar	0.1kVar	2kVar	
Apparent power deadband	0.1...1000.0kVA	0.1kVA	2kVA	
Power factor deadband	0.01...0.99	0.01	0.05	
Frequency deadband	0.01...1.00Hz	0.01Hz	0.1Hz	
Current deadband	0.01...50.00A	0.01A	5A	
Residual current deadband	0.01...50.00A	0.01A	0.2A	
Voltage deadband	0.01...5000.00V	0.01V	200V	
Residual voltage deadband	0.01...5000.00V	0.01V	200V	
Angle measurement deadband	0.1...5.0deg	0.1deg	1deg	
Integration time	0...10 000ms	1ms	0ms	Determines the integration time of the protocol. If this parameter is set to "0 ms", no integration time is in use.

5.3.7 Modbus I/O

The Modbus I/O protocol can be selected to communicate on the available serial ports. The Modbus I/O is actually a Modbus/RTU master implementation that is dedicated to communicating with serial Modbus/RTU slaves such as RTD input modules. Up to three (3) Modbus/RTU slaves can be connected to the same bus polled by the Modbus I/O implementation. These are named I/O Module A, I/O Module B and I/O Module C. Each of the modules can be configured using parameters in the following two tables.

Table. 5.3.7 - 211. Module settings.

Name	Range	Description
I/O module X address	0...247	Defines the Modbus unit address for the selected I/O Module (A, B, or C). If this setting is set to "0", the selected module is not in use.

Name	Range	Description
Module x type	<ul style="list-style-type: none"> ADAM-4018+ ADAM-4015 	Selects the module type.
Channels in use	Channel 0...Channel 7 (or None)	Selects the number of channels to be used by the module.

Table. 5.3.7 - 212. Channel settings.

Name	Range	Step	Default	Description
Thermocouple type	<ul style="list-style-type: none"> +/- 20mA 4...20mA Type J Type K Type T Type E Type R Type S 	-	4...20mA	Selects the thermocouple or the mA input connected to the I/O module. Types J, K, T and E are nickel-alloy thermocouples, while Types R and S are platinum/rhodium-alloy thermocouples.
Input value	-101.0...2000.0	0.1	-	Displays the input value of the selected channel.
Input status	<ul style="list-style-type: none"> Invalid OK 	-	-	Displays the input status of the selected channel.

5.4 Analog fault registers

At *Communication* → *General I/O* → *Analog fault registers* the user can set up to twelve (12) channels to record the measured value when a protection function starts or trips. These values can be read in two ways: locally from this same menu, or through a communication protocol if one is in use.

The following table presents the setting parameters available for the 12 channels.

Table. 5.4 - 213. Fault register settings.

Name	Range	Step	Default	Description
Select record source	Not in use I>, I>>, I>>>, I>>>> (IL1, IL2, IL3) Id>, Id>>, Id>>>, Id>>>> (IL1, IL2, IL3) IO>, IO>>, IO>>>, IO>>>> (IO) IOd>, IOd>>, IOd>>>, IOd>>>> (IO) FLX (Fault locator)	-	Not in use	Selects the protection function and its stage to be used as the source for the fault register recording. The user can choose between non-directional overcurrent, directional overcurrent, non-directional earth fault, directional earth fault, and fault locator functions.
Select record trigger	<ul style="list-style-type: none"> TRIP signal START signal START and TRIP signals 	-	TRIP signal	Selects what triggers the fault register recording: the selected function's TRIP signal, its START signal, or either one.

Name	Range	Step	Default	Description
Recorded fault value	- 1000 000.00...1 000 000.00	0.01	-	Displays the recorded measurement value at the time of the selected fault register trigger.

5.5 Real-time measurements to communication

With the *Real-time signals to communication* menu the user can report measurements to SCADA in a faster interval. The real measurement update delay depends on the used communication protocol and equipment used. Up to ten (10) magnitudes can be selected. The recorded value can be either a per-unit value or a primary value (set by the user).

Measurable values

Function block uses analog current and voltage measurement values. The device uses these values as the basis when it calculates the primary and secondary values of currents, voltages, powers, impedances and other values.

Table. 5.5 - 214. Available measured values.

Signals	Description
Currents	
IL1 (ff), IL2 (ff), IL3 (ff), I01 (ff), I02 (ff)	Fundamental frequency (RMS) current measurement values of phase currents and residual currents.
IL1 (TRMS), IL2 (TRMS), IL3 (TRMS), I01 (TRMS), I02 (TRMS)	TRMS current measurement values of phase currents and residual currents.
IL1, IL2, IL3, I01, I02 & 2 nd h., 3 rd h., 4 th h., 5 th h., 7 th h., 9 th h., 11 th h., 13 th h., 15 th h., 17 th h., 19 th h.	Magnitudes of the phase current components: 2 nd harmonic, 3 rd harmonic, 4 th harmonic, 5 th harmonic 7 th , harmonic 9 th , harmonic 11 th , harmonic 13 th , harmonic 15 th , harmonic 17 th , harmonic 19 th harmonic current.
I1, I2, I0Z	Positive sequence current, negative sequence current and zero sequence current.
I0CalcMag	Residual current calculated from phase currents.
IL1Ang, IL2Ang, IL3Ang, I01Ang, I02Ang, I0CalcAng I1Ang, I2Ang	Angles of each measured current.
Voltages	
UL1Mag, UL2Mag, UL3Mag, UL12Mag, UL23Mag, UL31Mag, U0Mag, U0CalcMag	Magnitudes of phase voltages, phase-to-phase voltages and residual voltages.
U1 Pos.seq V mag, U2 Neg.seq V mag	Positive and negative sequence voltages.
UL1Ang, UL2Ang, UL3Ang, UL12Ang, UL23Ang, UL31Ang, U0Ang, U0CalcAng	Angles of phase voltages, phase-to-phase voltages and residual voltages.

Signals	Description
U1 Pos.seq V Ang, U2 Neg.seq V Ang	Positive and negative sequence angles.
Powers	
S3PH P3PH Q3PH	Three-phase apparent, active and reactive power.
SL1, SL2, SL3, PL1, PL2, PL3, QL1, QL2, QL3	Phase apparent, active and reactive powers.
tanfi3PH tanfiL1 tanfiL2 tanfiL3	Tan (ϕ) of three-phase powers and phase powers.
cosfi3PH cosfiL1 cosfiL2 cosfiL3	Cos (ϕ) of three-phase powers and phase powers.
Impedances and admittances

Settings

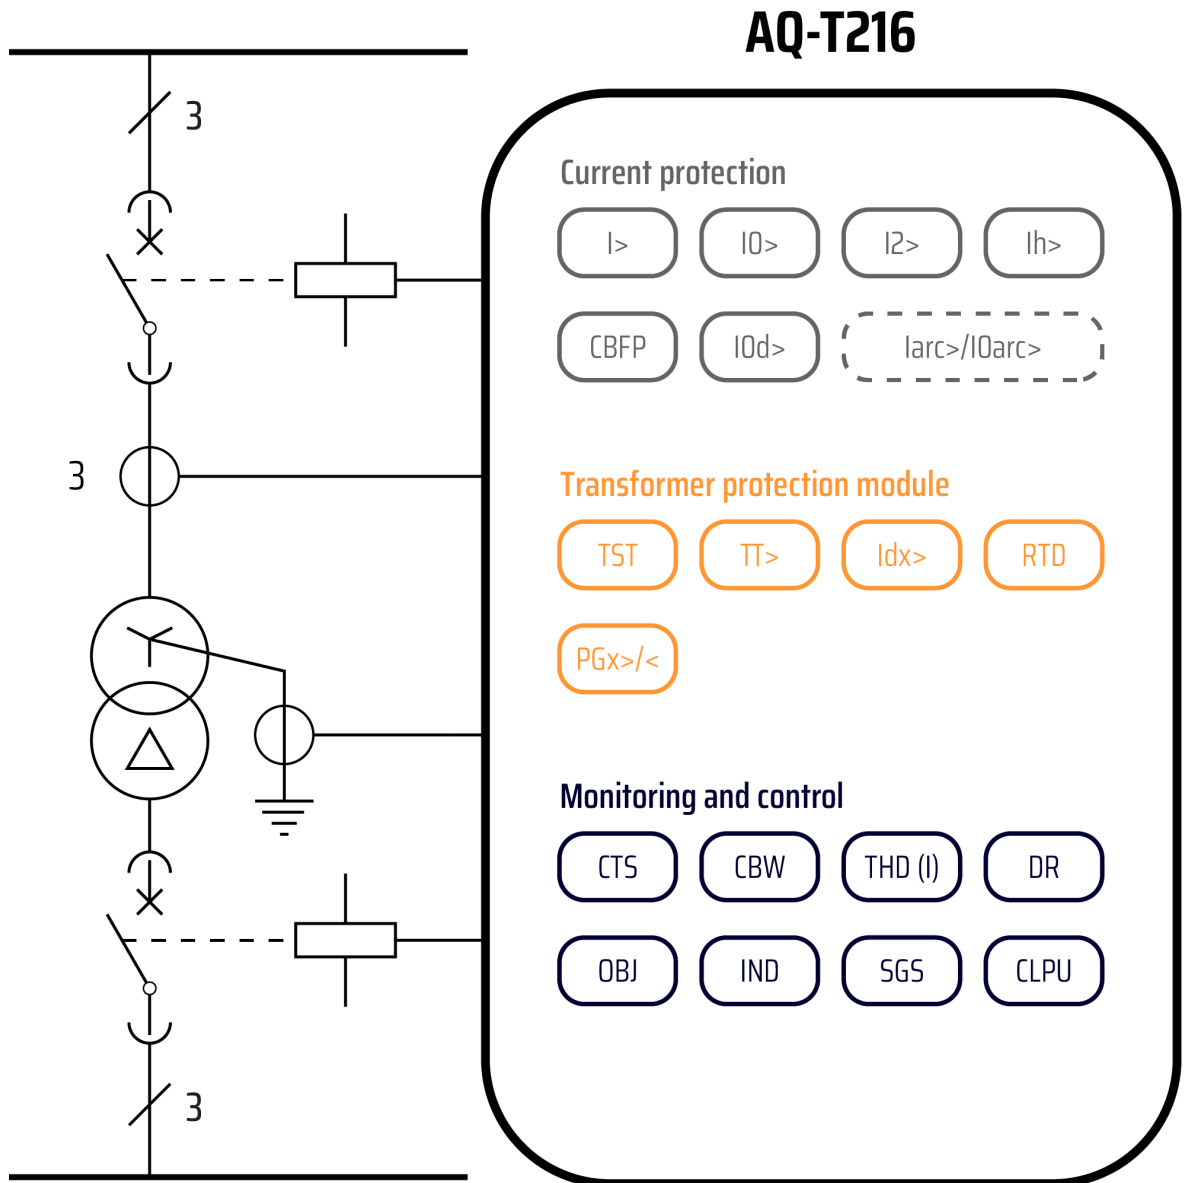

Table. 5.5 - 215. Settings.

Name	Range	Step	Default	Description
Measurement value recorder mode	<ul style="list-style-type: none"> Disabled Activated 	-	Disabled	Activates and disables the real-time signals to communication.
Scale current values to primary	<ul style="list-style-type: none"> No Yes 	-	No	Selects whether or not values are scaled to primary.
Slot X magnitude selection	<ul style="list-style-type: none"> Currents Voltages Powers Impedance (ZRX) and admittance (YGB) Others 	-	Currents	Selects the measured magnitude category of the chosen slot.
Slot X magnitude	Described in table above ("Available measured values")	-	-	Selects the magnitude in the previously selected category.
Magnitude X	-10 000 000.000...10 000 000.000	0.001	-	Displays the measured value of the selected magnitude of the selected slot. The unit depends on the selected magnitude (either amperes, volts, or per-unit values).

6 Connections and application examples

6.1 Connections of AQ-T216

Figure. 6.1 - 170. AQ-T216 application example with function block diagram.

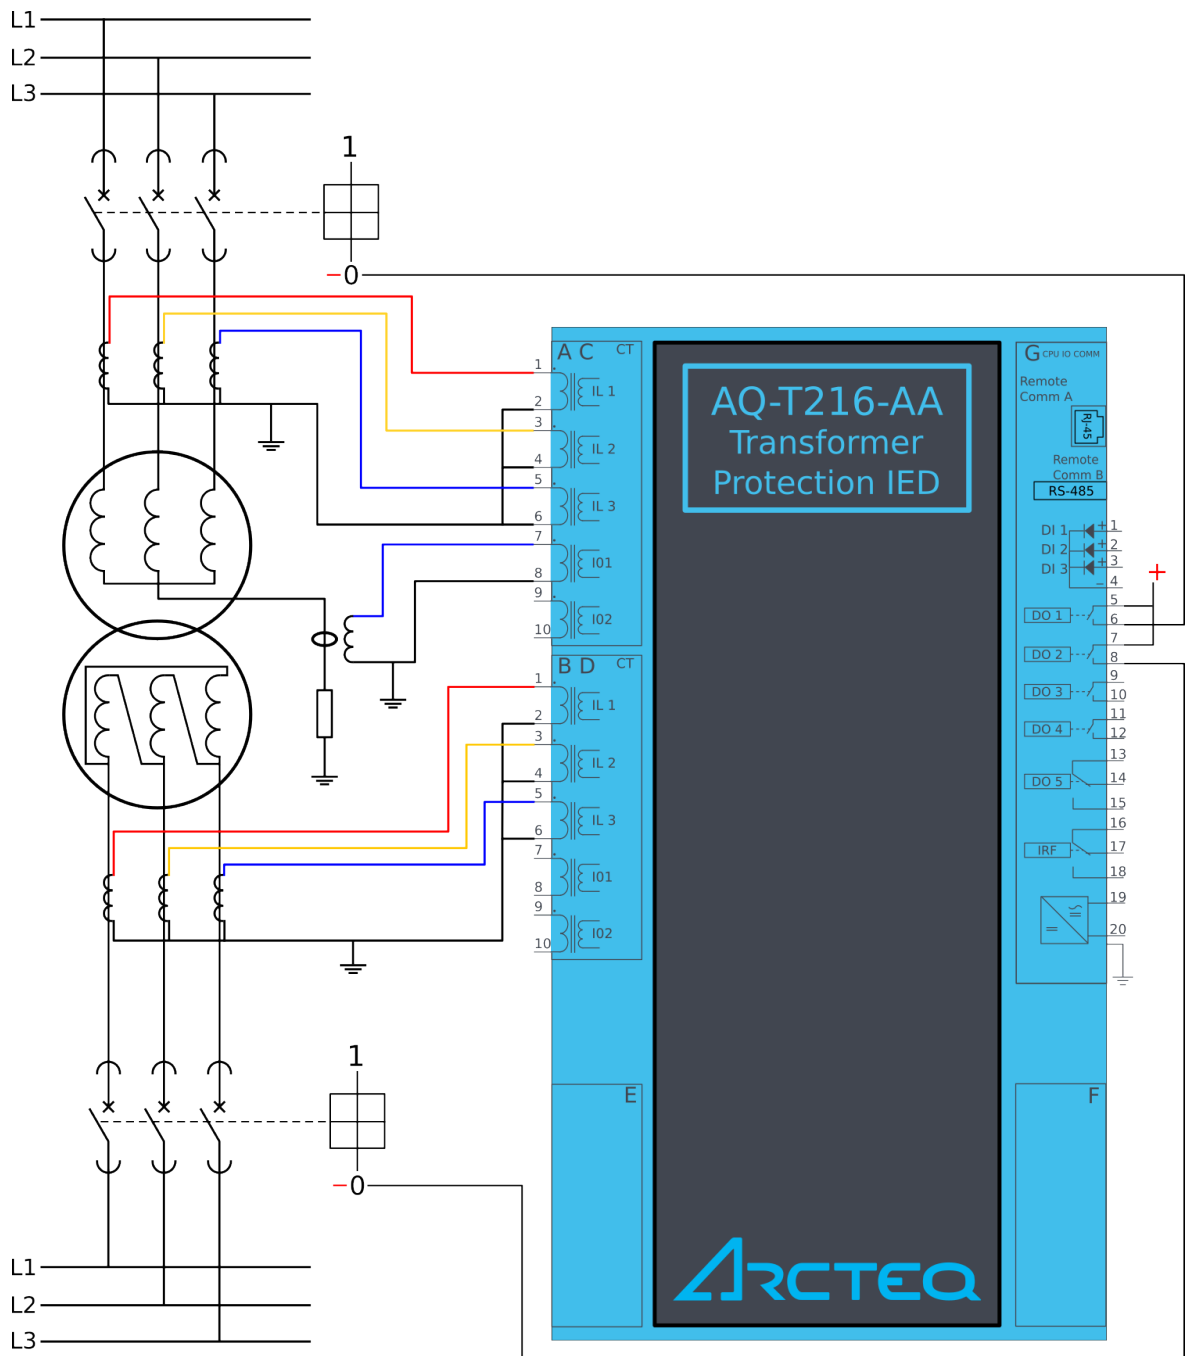

6.2 Application example and its connections

This chapter presents an application example for the two-winding transformer differential relay. The example is a regular differential scheme with restricted earth fault protection on the high-voltage side.

As can be seen in the image below, the example application has two current transformers. The first (upper) CT has the three phase current as well as the residual current (I_{01}) connected. The second CT also has the three phase currents but no residual current connected.

Figure. 6.2 - 171. Application example and its connections.

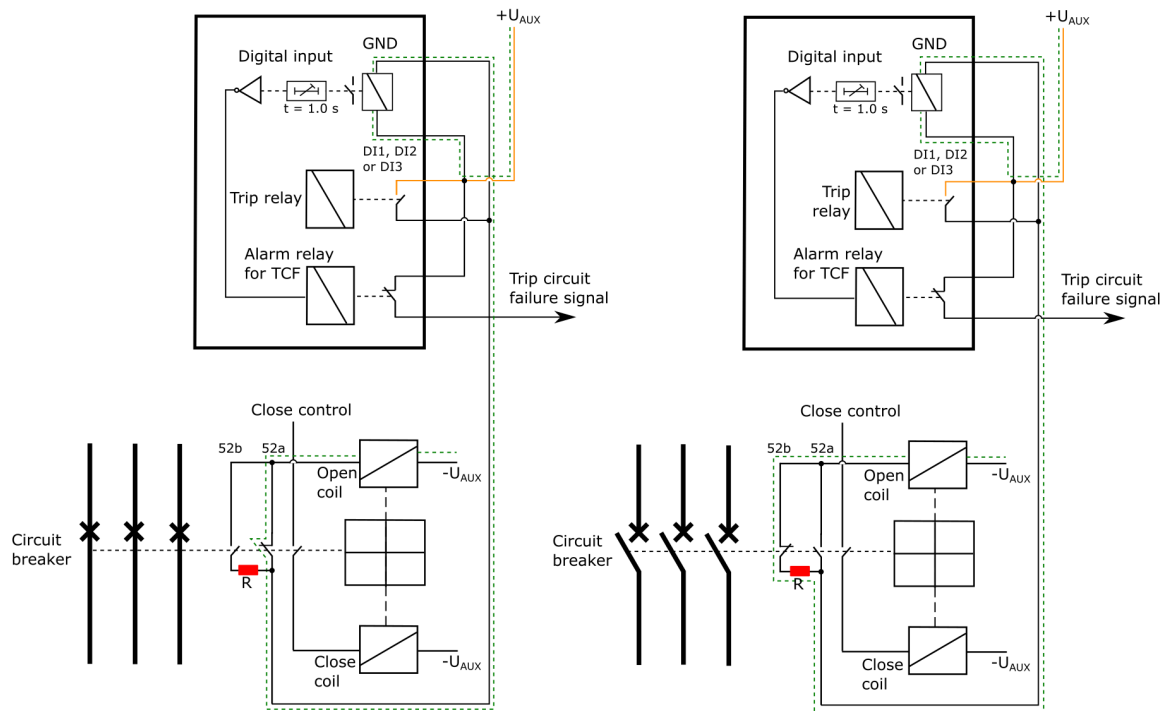

6.3 Trip circuit supervision (95)

Trip circuit supervision is used to monitor the wiring from auxiliary power supply, through the device's digital output, and all the way to the open coil of the breaker. It is recommended to supervise the health of the trip circuit when breaker is closed.

Trip circuit supervision with one digital input and one non-latched trip output

The figure below presents an application scheme for trip circuit supervision with one digital input and a non-latched trip output. With this connection the current keeps flowing to the open coil of the breaker via the breaker's closing auxiliary contacts (52b) even after the circuit breaker is opened. This requires a resistor which reduces the current: this way the coil is not energized and the relay output does not need to cut off the coil's inductive current.

Figure. 6.3 - 172. Trip circuit supervision with one DI and one non-latched trip output.

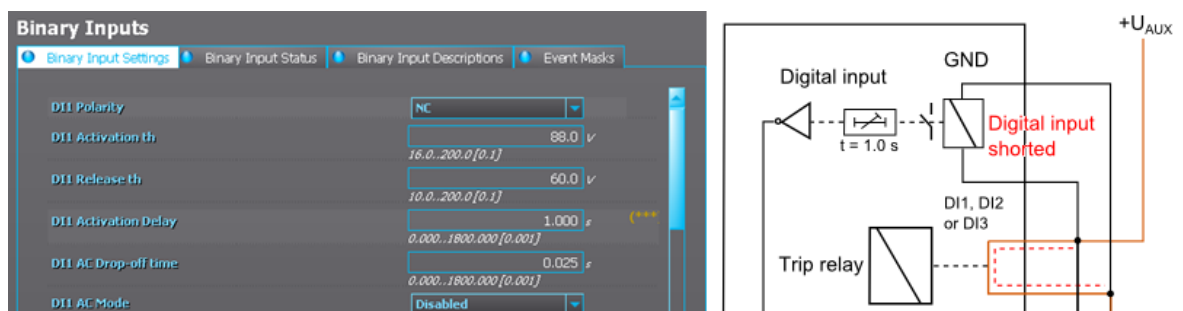

Note that the digital input that monitors the circuit is normally closed, and the same applies to the alarm relay if one is used. For monitoring and especially trip circuit supervision purposes it is recommended to use a normally closed contact to confirm the wiring's condition. An active digital input generates a less than 2 mA current to the circuit, which is usually small enough not to make the breaker's open coil operate.

When the trip relay is controlled and the circuit breaker is opening, the digital input is shorted by the trip contact as long as the breaker opens. Normally, this takes about 100 ms if the relay is non-latched. A one second activation delay should, therefore, be added to the digital input. An activation delay that is slightly longer than the circuit breaker's operations time should be enough. When circuit breaker failure protection (CBFP) is used, adding its operation time to the digital input activation time is useful. The whole digital input activation time is, therefore, $t_{DI} = t_{CB} + t_{IEDrelease} + t_{CBFP}$.

The image below presents the necessary settings when using a digital input for trip circuit supervision. The input's polarity must be NC (normally closed) and a one second delay is needed to avoid nuisance alarm while the circuit breaker is controlled open.

Figure. 6.3 - 173. Settings for a digital input used for trip circuit supervision.

Non-latched outputs are seen as hollow circles in the output matrix, whereas latched contacts are painted. See the image below of an output matrix where a non-latched trip contact is used to open the circuit breaker.

Figure. 6.3 - 174. Non-latched trip contact.

Inputs	OUT1	OUT2	OUT3	OUT4	OUT5
I> START (General)					
I> START(A)					
I> START(B)					
I> START(C)					
I> TRIP (General)					
I> TRIP(A)					
I> TRIP(B)					
I> TRIP(C)					
I> BLOCKED					

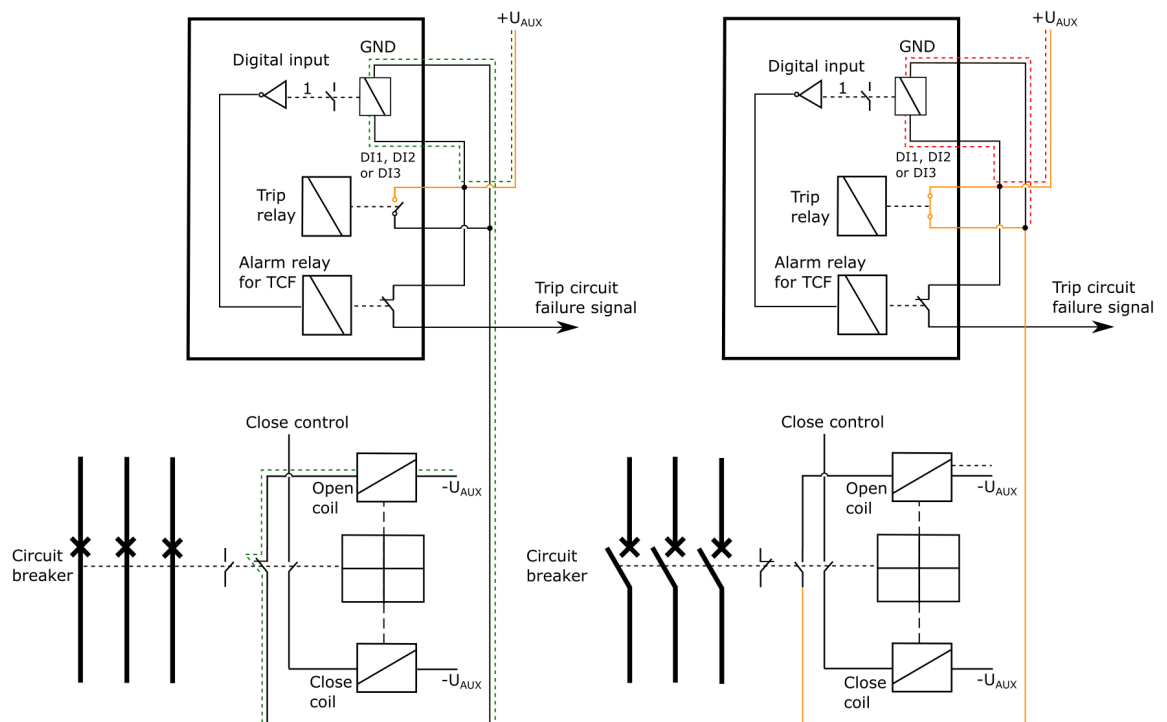

When the auto-reclosing function is used in feeder applications, the trip output contacts must be non-latched. Trip circuit supervision is generally easier and more reliable to build with non-latched outputs.

The open coil remains energized only as long as the circuit breaker is opened and the output releases. This takes approximately 100 ms depending on the size and type of the breaker. When the breaker opens, the auxiliary contacts open the inductive circuit; however, the trip contact does not open at the same time. The device's output relay contact opens in under 50 ms or after a set release delay that takes place after the breaker is opened. This means that the open coil is energized for a while after the breaker has already opened. The coil could even be energized a moment longer if the circuit breaker failure protection has to be used and the incomer performs the trip.

Trip circuit supervision with one digital input and one connected, non-latched trip output

There is one main difference between non-latched and latched control in trip circuit supervision: when using the latched control, the trip circuit (in an open state) cannot be monitored as the digital input is shorted by the device's trip output.

Figure. 6.3 - 175. Trip circuit supervision with one DI and one latched output contact.

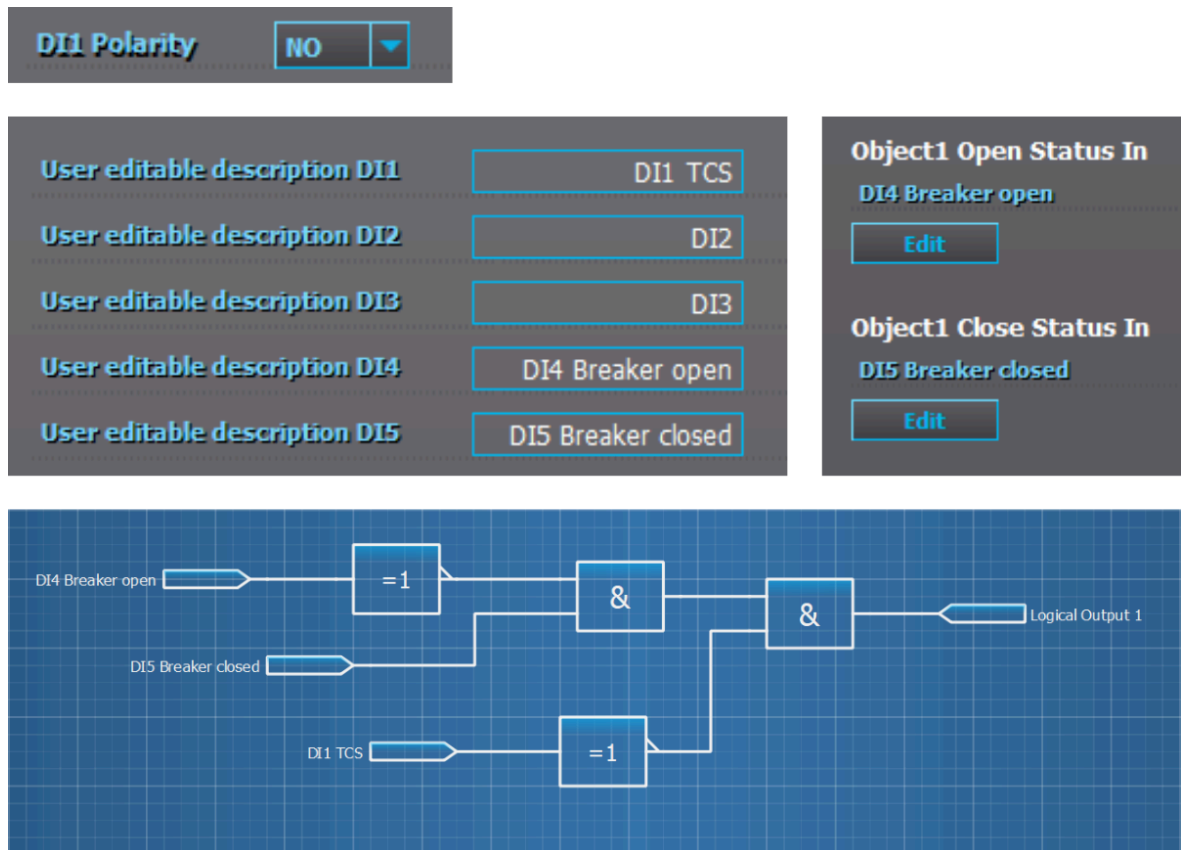

The trip circuit with a latched output contact can be monitored, but only when the circuit breaker's status is "Closed". Whenever the breaker is open, the supervision is blocked by an internal logic scheme. Its disadvantage is that the user does not know whether or not the trip circuit is intact when the breaker is closed again.

The following logic scheme (or similar) blocks the supervision alarm when the circuit breaker is open. The alarm is issued whenever the breaker is closed and whenever the inverted digital input signal ("TCS") activates. A normally closed digital input activates only when there is something wrong with the trip circuit and the auxiliary power goes off. Logical output can be used in the output matrix or in SCADA as the user wants.

The image below presents a block scheme when a non-latched trip output is not used.

Figure. 6.3 - 176. Example block scheme.

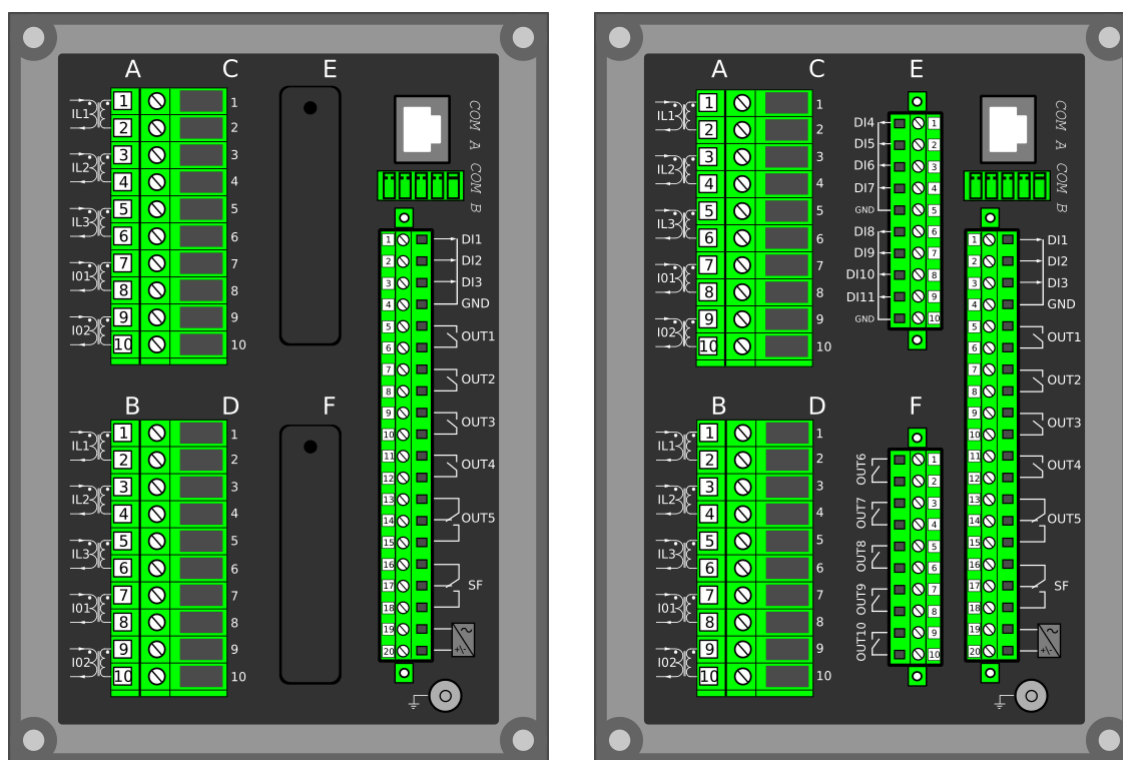

7 Construction and installation

7.1 Construction

AQ-X216 is a member of the modular and scalable AQ-200 series, and it includes two (2) configurable and modular add-on card slots. As a standard configuration the device includes the CPU module (which consists of the CPU, a number of inputs and outputs, and the power supply) as well as two separate current measurement modules.

The images below present the modules of both the non-optional model (AQ-X216-XXXXXXX-AA, on the left) and the fully optional model (AQ-X216-XXXXXXX-BC, on the right).

Figure. 7.1 - 177. Modular construction of AQ-X216.

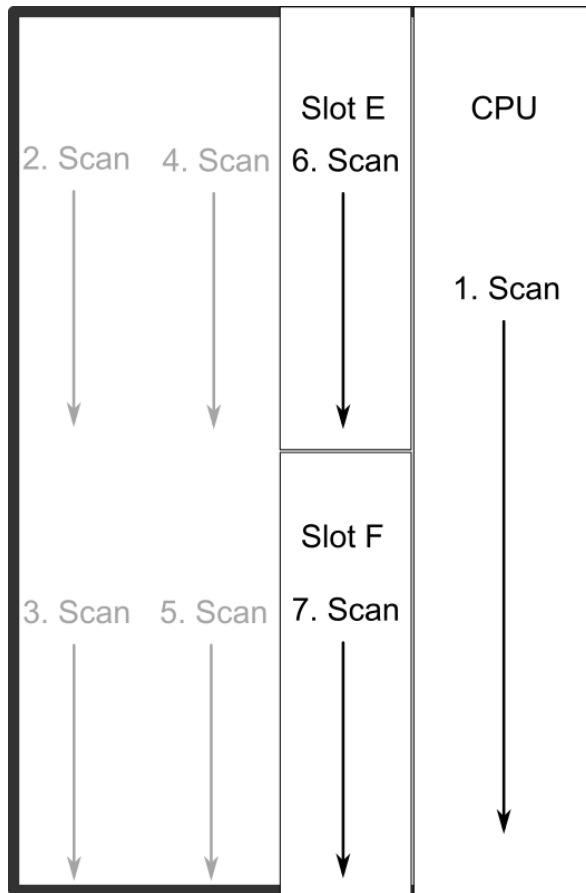

The modular structure of AQ-X216 allows for scalable solutions for different application requirements. In non-standard configurations Slots E and F accept all available add-on modules, such as digital I/O modules, integrated arc protection and other special modules.

Start-up scan searches for modules according to their type designation code. If the module content is not what the device expects, the device issues a hardware configuration error message. In field upgrades, therefore, add-on modules must be ordered from Arcteq Relays Ltd. or its representative who can then provide the module with its corresponding unlocking code to allow the device to operate correctly once the hardware configuration has been upgraded.

When an I/O module is inserted into the device, the module location affects the naming of the I/O. The I/O scanning order in the start-up sequence is as follows: the CPU module I/O, Slot E, and Slot F. This means that the digital input channels DI1, DI2 and DI3 as well as the digital output channels OUT1, OUT2, OUT3, OUT4 and OUT5 are always located in the CPU module. If additional I/O cards are installed, their location and card type affect the I/O naming.

The figure below presents the start-up hardware scan order of the device as well as the I/O naming principles.

Figure. 7.1 - 178. AQ-X216 hardware scanning and I/O naming principles.

1. Scan
The start-up system; detects and self-tests the CPU module, voltages, communication and the I/O; finds and assigns "DI1", "DI2", "DI3", "OUT1", "OUT2", "OUT3", "OUT4" and "OUT5".
2. Scan
Scans Slot A, which should always remain empty in AQ-X216 devices. If it is not empty, the device issues an error message.
3. Scan
Scans Slot B, which should always remain empty in AQ-X216 devices. If it is not empty, the device issues an error message.
4. Scan
Scans Slot C, and finds the five channels of the first CT module. If the CTM is not found, the device issues an alarm.
5. Scan
Scans Slot D, and finds the five channels of the second CT module. If the CTM is not found, the device issues an alarm.
6. Scan
Scans Slot E, and moves to the next slot if Slot E is empty. If the scan finds an 8DI module (that is, a module with eight digital inputs), it reserves the designations "DI4", "DI5", "DI6", "DI7", "DI8", "DI9", "DI10" and "DI11" to this slot. If the scan finds a DO5 module (that is, a module with five digital outputs), it reserves the designations "OUT6", "OUT7", "OUT8", "OUT9" and "OUT10" to this slot. The I/O is then added if the type designation code (e.g. AQ-P215-PH0AAAA-BBC) matches with the existing modules in the device. If the code and the modules do not match, the device issues and alarm. An alarm is also issued if the device expects to find a module here but does not find one.

7. Scan

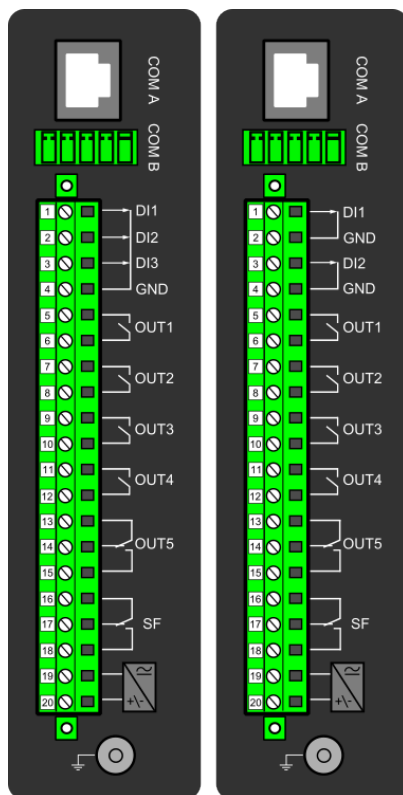

Scans Slot F, and moves to the next slot if Slot F is empty. If the scan finds an 8DI module, it reserves the designations "DI4", "DI5", "DI6", "DI7", "DI8", "DI9", "DI10" and "DI11" to this slot. If Slot E also has an 8DI module (and therefore has already reserved these designations), the device reserves the designations "DI12", "DI13", "DI14", "DI15", "DI16", "DI17", "DI18" and "DI19" to this slot. If the scan finds a 5DO module, it reserves the designations "OUT6", "OUT7", "OUT8", "OUT9" and "OUT10" to this slot. Again, if Slot E also has a 5DO and has therefore already reserved these designations, the device reserves the designations "OUT11", "OUT12", "OUT13", "OUT14" and "OUT15" to this slot.

Thus far this chapter has only explained the installation of I/O add-on cards to the option module slots. This is because all other module types are treated in a same way. For example, when an additional communication port is installed into the upper port of the communication module, its designation is Communication port 3 or higher, as Communication ports 1 and 2 already exist in the CPU module (which is scanned, and thus designated, first). After a communication port is detected, it is added into the device's communication space and its corresponding settings are enabled.

The fully optioned example case of AQ-X216-XXXXXXX-BC (the first image pair, on the right) has a total of 11 digital input channels available: three (DI1...DI3) in the CPU module, and eight (DI4...DI11) in Slot E. It also has a total of 10 digital output channels available: five (DO1...DO5) in the CPU module, and five (DO6...DO10) in Slot F. These same principles apply to all non-standard configurations in the AQ-X216 devices.

7.2 CPU module

Figure. 7.2 - 179. CPU module.

Module connectors

Table. 7.2 - 216. Module connector descriptions.

Connector	Description	
COM A	Communication port A, or the RJ-45 port. Used for the setting tool connection and for IEC 61850, Modbus/TCP, IEC 104, DNP3 and station bus communications.	
COM B	Communication port B, or the RS-485 port. Used for the SCADA communications for the following protocols: Modbus/RTU, Modbus I/O, SPA, DNP3, IEC 101 and IEC 103. The pins have the following designations: Pin 1 = DATA +, Pin 2 = DATA –, Pin 3 = GND, Pins 4 & 5 = Terminator resistor enabled by shorting.	
	Model with 3 digital inputs	Model with 2 digital inputs
X 1	Digital input 1, nominal threshold voltage 24 V, 110 V or 220 V.	Digital input 1, nominal threshold voltage 24 V, 110 V or 220 V.
X 2	Digital input 2, nominal threshold voltage 24 V, 110 V or 220 V.	GND for digital input 1.
X 3	Digital input 3, nominal threshold voltage 24 V, 110 V or 220 V.	Digital input 2, nominal threshold voltage 24 V, 110 V or 220 V.
X 4	Common GND for digital inputs 1, 2 and 3.	GND for digital input 2.
X 5:6	Output relay 1, with a normally open (NO) contact.	
X 7:8	Output relay 2, with a normally open (NO) contact.	
X 9:10	Output relay 3, with a normally open (NO) contact.	
X 11:12	Output relay 4, with a normally open (NO) contact.	
X 13:14:15	Signaling relay 5, with a changeover contact. Not to be used in trip coil control.	
X 16:17:18	System fault's signaling relay, with a changeover contact. Pins 16 and 17 are closed when the unit has a system fault or is powered OFF. Pins 16 and 18 are closed when the unit is powered ON and there is no system fault.	
X 19:20	Power supply IN. Either 80...265 VAC/DC (model A; order code "H") or 18...75 DC (model B; order code "L"). Positive side (+) to Pin 20.	
GND	The device's earthing connector.	

By default, the CPU module (combining the CPU, the I/O and the power supply) is included in all AQ-200 devices to provide two standard communication ports and the device's basic digital I/O. The module can be ordered to include 2 or 3 digital inputs.

The digital output controls are also set by the user with software. Digital outputs are controlled in 5 ms program cycles. All output contacts are mechanical. The rated voltage of the NO/NC outputs is 250 VAC/DC.

The auxiliary voltage is defined in the ordering code: the available power supply models available are A (80...265 VAC/DC) and B (18...75 DC). For further details, please refer to the "Auxiliary voltage" chapter in the "Technical data" section of this document.

Digital inputs

The current consumption of the digital inputs is 2 mA when activated, while the range of the operating voltage is 24 V/110 V/220 V depending on the ordered hardware. All digital inputs are scanned in 5 ms program cycles, and their pick-up and release delays as well as their NO/NC selection can be set with software.

The settings described in the table below can be found at *Control* → *Device I/O* → *Digital input settings* in the device settings.

Table. 7.2 - 217. Digital input settings.

Name	Range	Step	Default	Description
Dlx Polarity	<ul style="list-style-type: none"> NO (Normally open) NC (Normally closed) 	-	NO	Selects whether the status of the digital input is 1 or 0 when the input is energized.
Dlx Activation delay	0.000...1800.000 s	0.001 s	0.000 s	Defines the delay for the status change from 0 to 1.
Dlx Drop-off time	0.000...1800.000 s	0.001 s	0.000 s	Defines the delay for the status change from 1 to 0.
Dlx AC mode	<ul style="list-style-type: none"> Disabled Enabled 	-	Disabled	Selects whether or not a 30-ms deactivation delay is added to account for alternating current.

Digital input and output descriptions

CPU card digital inputs and outputs can be given a description. The user defined description are displayed in most of the menus:

- logic editor
- matrix
- block settings
-
-
- etc.

Table. 7.2 - 218. Digital input and output user description.

Name	Range	Default	Description
User editable description Dlx	1...31 characters	Dlx	Description of the digital input. This description is used in several menu types for easier identification.
User editable description OUTx		OUTx	Description of the digital output. This description is used in several menu types for easier identification.

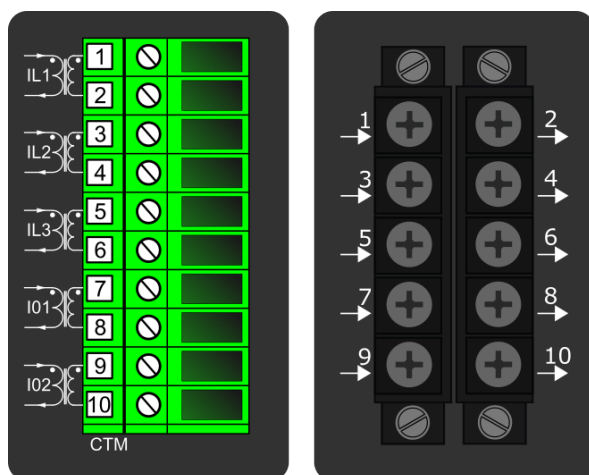

Scanning cycle

All digital inputs are scanned in a 5 ms cycle, meaning that the state of an input is updated every 0...5 milliseconds. When an input is used internally in the device (either in setting group change or logic), it takes additional 0...5 milliseconds to operate. Theoretically, therefore, it takes 0...10 milliseconds to change the group when a digital input is used for group control or a similar function. In practice, however, the delay is between 2...8 milliseconds about 95 % of the time. When a digital input is connected directly to a digital output (T1...Tx), it takes an additional 5 ms round. Therefore, when a digital input controls a digital output internally, it takes 0...15 milliseconds in theory and 2...13 milliseconds in practice.

Please note that the mechanical delay of the relay is not included in these approximations.

7.3 Current measurement module

Figure. 7.3 - 180. Module connections with standard and ring lug terminals.

Connector	Description
CTM 1-2	Phase current measurement for phase L1 (A).
CTM 3-4	Phase current measurement for phase L2 (B).
CTM 5-6	Phase current measurement for phase L3 (C).
CTM 7-8	Coarse residual current measurement IO1.
CTM 9-10	Fine residual current measurement IO2.

A basic current measurement module with five channels includes three-phase current measurement inputs as well as coarse and fine residual current inputs. The CT module is available with either standard or ring lug connectors.

The current measurement module is connected to the secondary side of conventional current transformers (CTs). The nominal current for the phase current inputs is 5 A. The input nominal current can be scaled for secondary currents of 1...10 A. The secondary currents are calibrated to nominal currents of 1 A and 5 A, which provide $\pm 0.5\%$ inaccuracy when the range is $0.005...4 \times I_n$.

The measurement ranges are as follows:

- Phase currents 25 mA...250 A (RMS)
- Coarse residual current 5 mA...150 A (RMS)

- Fine residual current 1 mA...75 A (RMS)

The characteristics of phase current inputs are as follows:

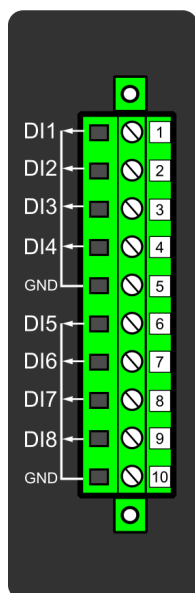

- The angle measurement inaccuracy is less than ± 0.2 degrees with nominal current.
- The frequency measurement range of the phase current inputs is 6...1800 Hz with standard hardware.
- The quantization of the measurement signal is applied with 18-bit AD converters, and the sample rate of the signal is 64 samples/cycle when the system frequency ranges from 6 Hz to 75 Hz.

For further details please refer to the "Current measurement" chapter in the "Technical data" section of this document.

7.4 Option cards

7.4.1 Digital input module (optional)

Figure. 7.4.1 - 181. Digital input module (DI8) with eight add-on digital inputs.

Connector	Description (x = the number of digital inputs in other modules that precede this one in the configuration)
X 1	DIx + 1
X 2	DIx + 2
X 3	DIx + 3
X 4	DIx + 4
X 5	Common earthing for the first four digital inputs.
X 6	DIx + 5
X 7	DIx + 6
X 8	DIx + 7

Connector	Description (x = the number of digital inputs in other modules that precede this one in the configuration)
X 9	Dlx + 8
X 10	Common earthing for the other four digital inputs.

The DI8 module is an add-on module with eight (8) galvanically isolated digital inputs. This module can be ordered directly to be installed into the device in the factory, or it can be upgraded in the field after the device's original installation when required. The properties of the inputs in this module are the same as those of the inputs in the main processor module. The current consumption of the digital inputs is 2 mA when activated, while the range of the operating voltage is from 0...265 VAC/DC. The activation and release thresholds are set in the software and the resolution is 1 V. All digital inputs are scanned in 5 ms program cycles, and their pick-up and release delays as well as their NO/NC selection can be set with software.

For the naming convention of the digital inputs provided by this module please refer to the chapter titled "Construction and installation".

For technical details please refer to the chapter titled "Digital input module" in the "Technical data" section of this document.

Setting up the activation and release delays

The settings described in the table below can be found at *Control* → *Device I/O* → *Digital input settings* in the device settings.

Table. 7.4.1 - 219. Digital input settings of DI8 module.

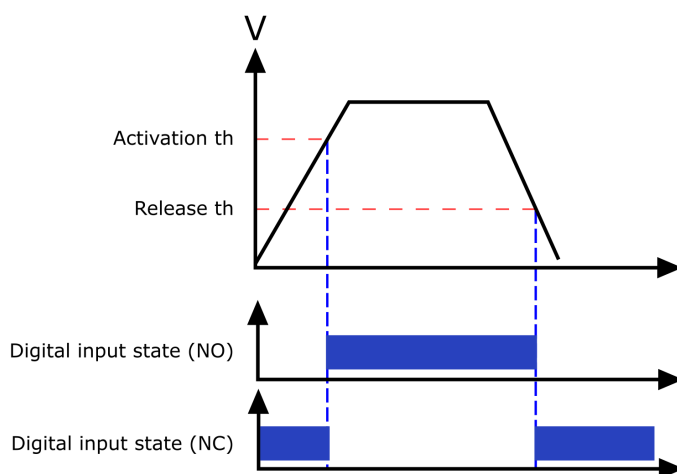

Name	Range	Step	Default	Description
Dlx Polarity	<ul style="list-style-type: none"> NO (Normally open) NC (Normally closed) 	-	NO	Selects whether the status of the digital input is 1 or 0 when the input is energized.
Dlx Activation threshold	16.0...200.0 V	0.1 V	88 V	Defines the activation threshold for the digital input. When "NO" is the selected polarity, the measured voltage exceeding this setting activates the input. When "NC" is the selected polarity, the measured voltage exceeding this setting deactivates the input.
Dlx Release threshold	10.0...200.0 V	0.1 V	60V	Defines the release threshold for the digital input. When "NO" is the selected polarity, the measured voltage below this setting deactivates the input. When "NC" is the selected polarity, the measured voltage below this setting activates the input.
Dlx Activation delay	0.000...1800.000 s	0.001 s	0.000 s	Defines the delay when the status changes from 0 to 1.
Dlx Drop-off time	0.000...1800.000 s	0.001 s	0.000 s	Defines the delay when the status changes from 1 to 0.
Dlx AC Mode	<ul style="list-style-type: none"> Disabled Enabled 	-	Disabled	Selects whether or not a 30-ms deactivation delay is added to take the alternating current into account. The "Dlx Release threshold" parameter is hidden and forced to 10 % of the set "Dlx Activation threshold" parameter.

Name	Range	Step	Default	Description
Dlx Counter	$0 \dots 2^{32} - 1$	1	0	Displays the number of times the digital input has changed its status from 0 to 1.
Dlx Clear counter	<ul style="list-style-type: none"> - Clear 	-	-	Resets the Dlx counter value to zero.

The user can set the activation threshold individually for each digital input. When the activation and release thresholds have been set properly, they will result in the digital input states to be activated and released reliably. The selection of the normal state between normally open (NO) and normally closed (NC) defines whether or not the digital input is considered activated when the digital input channel is energized.

The diagram below depicts the digital input states when the input channels are energized and de-energized.

Figure. 7.4.1 - 182. Digital input state when energizing and de-energizing the digital input channels.

Digital input descriptions

Option card inputs can be given a description. The user defined description are displayed in most of the menus:

- logic editor
- matrix
- block settings
-
-
- etc.

Table. 7.4.1 - 220. Digital input user description.

Name	Range	Default	Description
User editable description Dlx	1...31 characters	Dlx	Description of the digital input. This description is used in several menu types for easier identification.

Digital input voltage measurements

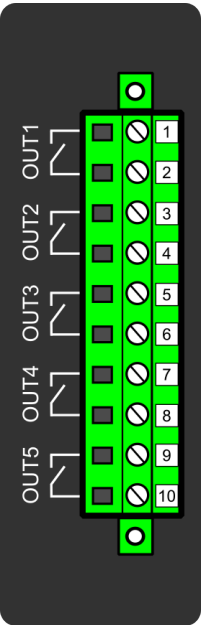

Digital input option card channels measure voltage on each channel. The measured voltage can be seen at *Control* → *Device IO* → *Digital inputs* → *Digital input voltages*.

Table. 7.4.1 - 221. Digital input channel voltage measurement.

Name	Range	Step	Description
Dlx Voltage now	0.000...275.000 V	0.001 V	Voltage measurement of a digital input channel.

7.4.2 Digital output module (optional)

Figure. 7.4.2 - 183. Digital output module (DO5) with five add-on digital outputs.

Connector	Description
X 1–2	OUTx + 1 (1 st and 2 nd pole NO)
X 3–4	OUTx + 2 (1 st and 2 nd pole NO)
X 5–6	OUTx + 3 (1 st and 2 nd pole NO)
X 7–8	OUTx + 4 (1 st and 2 nd pole NO)
X 9–10	OUTx + 5 (1 st and 2 nd pole NO)

The DO5 module is an add-on module with five (5) digital outputs. This module can be ordered directly to be installed into the device in the factory, or it can be upgraded in the field after the device's original installation when required. The properties of the outputs in this module are the same as those of the outputs in the main processor module. The user can set the digital output controls with software. All digital outputs are scanned in 5 ms program cycles, and their contacts are mechanical in type. The rated voltage of the NO/NC outputs is 250 VAC/DC.

For the naming convention of the digital inputs provided by this module please refer to the chapter titled "Construction and installation".

For technical details please refer to the chapter titled "Digital output module" in the "Technical data" section of this document.

Digital output descriptions

Option card outputs can be given a description. The user defined description are displayed in most of the menus:

- logic editor
- matrix
- block settings
-
-
- etc.

Table. 7.4.2 - 222. Digital output user description.

Name	Range	Default	Description
User editable description OUTx	1...31 characters	OUTx	Description of the digital output. This description is used in several menu types for easier identification.

7.4.3 Point sensor arc protection module (optional)

Figure. 7.4.3 - 184. Arc protection module.

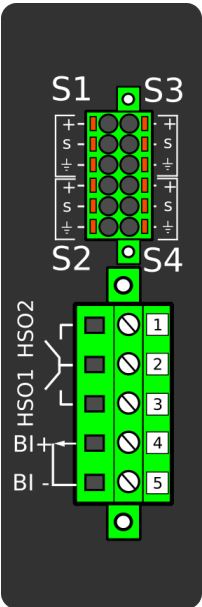

Table. 7.4.3 - 223. Module connections.

Connector	Description
S1	Light sensor channels 1...4 with positive ("+"), sensor ("S") and earth connectors.
S2	

Connector	Description
S3	
S4	
X 1	HSO2 (+, NO)
X 2	Common battery positive terminal (+) for the HSOs.
X 3	HSO1 (+, NO)
X 4	Binary input 1 (+ pole)
X 5	Binary input 1 (– pole)

The arc protection module is an add-on module with four (4) light sensor channels, two (2) high-speed outputs and one (1) binary input. This module can be ordered directly to be installed into the device in the factory, or it can be upgraded in the field after the device's original installation when required. If even one of the sensor channels is connected incorrectly, the channel does not work. Each channel can have up to three (3) light sensors serially connected to it. The user can choose how many of the channels are in use.

The high-speed outputs (HSO1 and HSO2) operate only with a DC power supply. The battery's positive terminal (+) must be wired according to the drawing. The NO side of the outputs 1 or 2 must be wired through trip coil to the battery's negative terminal (–). The high-speed outputs can withstand voltages up to 250 VDC. The operation time of the high-speed outputs is less than 1 ms. For further information please refer to the chapter titled "Arc protection module" in the "Technical data" section of this manual.

The rated voltage of the binary input is 24 VDC. The threshold picks up at ≥ 16 VDC. The binary input can be used for external light information or for similar applications. It can also be used as a part of various ARC schemes. Please note that the binary input's delay is 5...10ms.

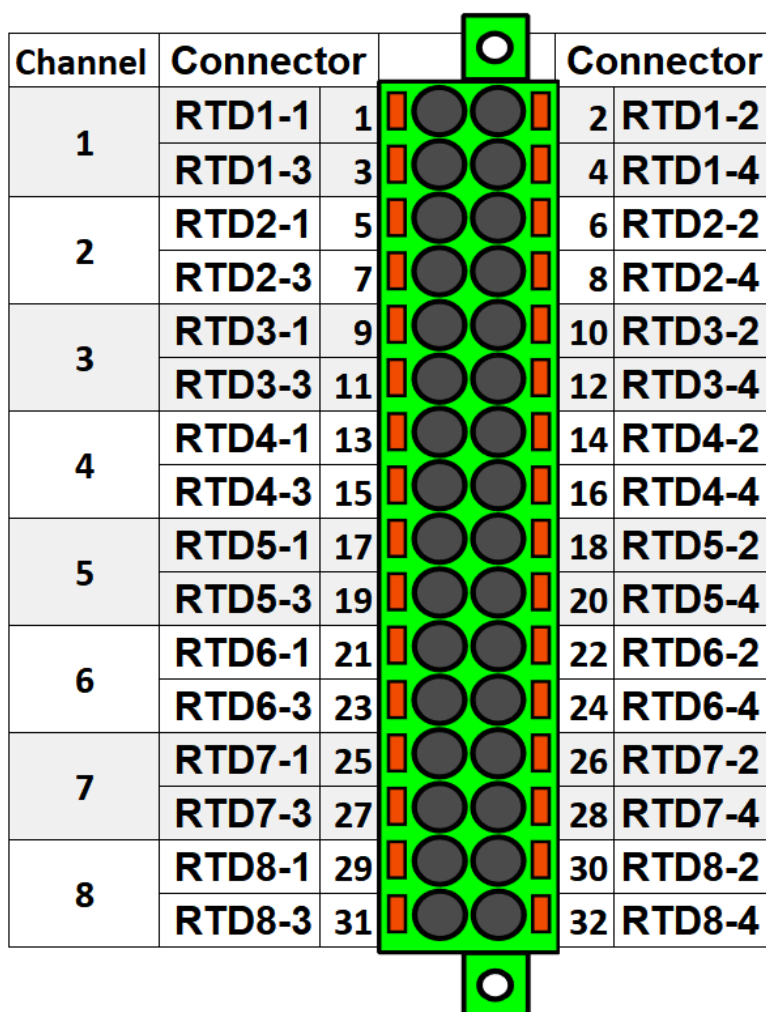

NOTICE!

BI1, HSO1 and HSO2 are not visible in the *Binary inputs* and *Binary outputs* menus (*Control* → *Device I/O*), they can only be programmed in the arc matrix menu (*Protection* → *Arc protection* → *I/O* → *Direct output control* and *HSO control*).

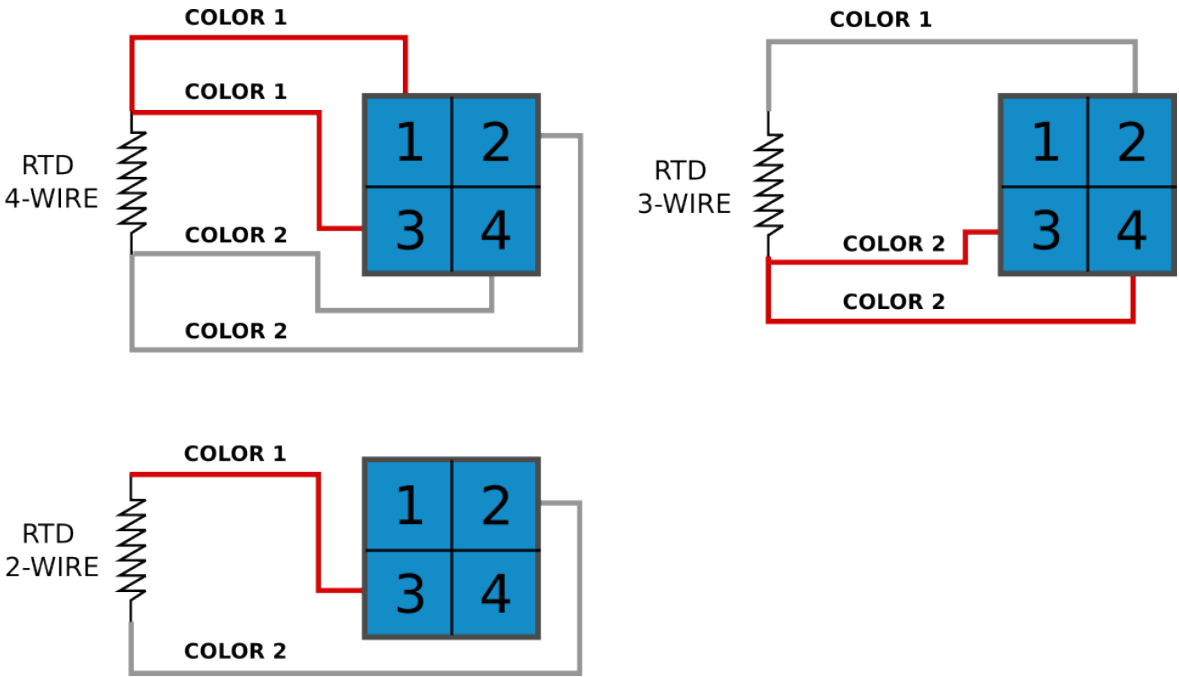

7.4.4 RTD input module (optional)

Figure. 7.4.4 - 185. RTD input module connectors.

The RTD input module is an add-on module with eight (8) RTD input channels. Each input supports 2-wire, 3-wire and 4-wire RTD sensors. The sensor type can be selected with software for two groups, four channels each. The card supports Pt100 and Pt1000 sensors

Figure. 7.4.4 - 186. RTD sensor connection types.

7.4.5 Serial RS-232 communication module (optional)

Figure. 7.4.5 - 187. Serial RS-232 module connectors.

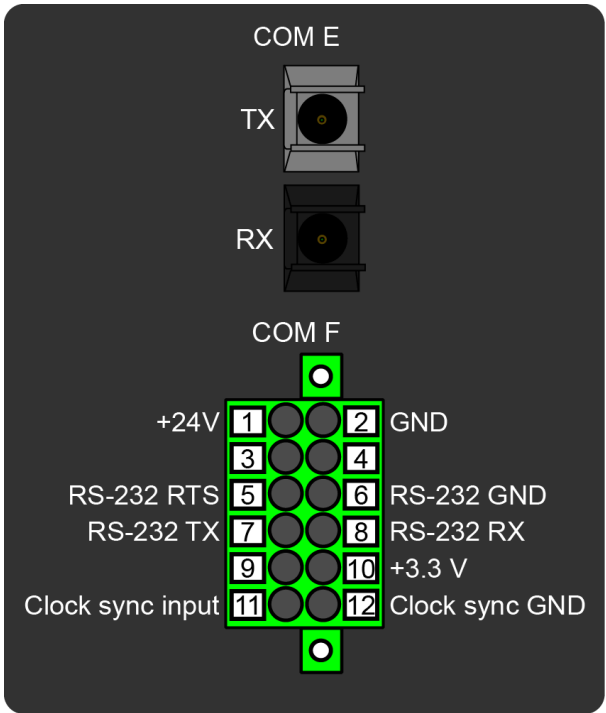

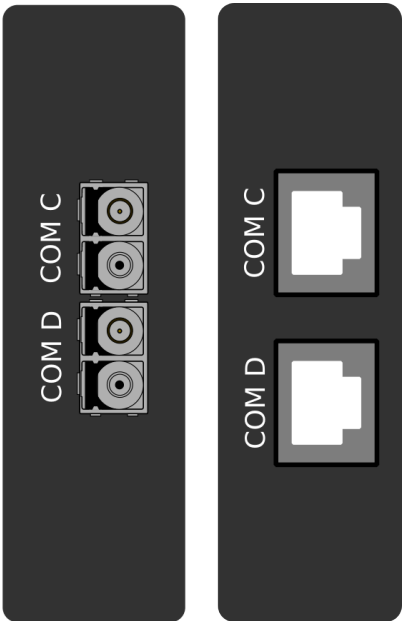

Table. 7.4.5 - 224. Module connections.

Connector	Pin	Name	Description
COM E	-	Serial fiber	<ul style="list-style-type: none"> Serial-based communications Port options: <ul style="list-style-type: none"> Glass/glass Plastic/plastic Glass/plastic Plastic/glass Wavelength 660 nm Compatible with 50/125 μm, 62.5/125 μm, 100/140 μm, and 200 μm Plastic-Clad Silica (PCS) fiber Compatible with ST connectors
COM F	1	+24 V input	Optional external auxiliary voltage for serial fiber.
	2	GND	
	3	-	Not in use.
	4		
	5	RS-232 RTS	Serial based communications.
	6	RS-232 GND	
	7	RS-232 TX	
	8	RS-232 RX	
	9	-	Not in use.
	10	+3.3 V output (spare)	Spare power source for external equipment (45 mA).
	11	Clock sync input	Clock synchronization input (supports IRIG-B).
	12	Clock sync GND	

The option card includes two serial communication interfaces: COM E is a serial fiber interface with glass/glass, plastic/plastic, glass/plastic and plastic/glass options, COM F is an RS-232 interface.

7.4.6 LC or RJ45 100 Mbps Ethernet communication module (optional)

Figure. 7.4.6 - 188. LC and RJ45 100 Mbps Ethernet module connectors.

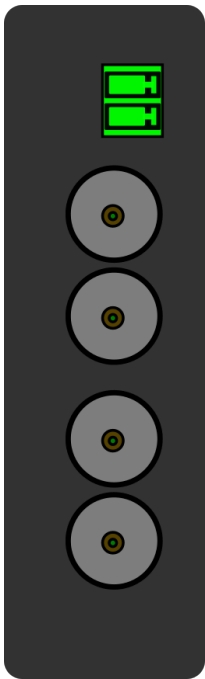

Connector	Description (LC ports)	Description (RJ45)
COM C:	<ul style="list-style-type: none">• Communication port C, 100 MbpsLC fiber connector.• 62.5/125 μm or 50/125 μm multimode (glass).• Wavelength 1300 nm.	<ul style="list-style-type: none">• RJ-45 connectors• 10BASE-T and 100BASE-TX
COM D:	<ul style="list-style-type: none">• Communication port D, 100 Mbps LC fiber connector.• 62.5/125 μm or 50/125 μm multimode (glass).• Wavelength 1300 nm.	<ul style="list-style-type: none">• RJ-45 connectors• 10BASE-T and 100BASE-TX

Both cards support both HSR and PRP protocols.

7.4.7 Double ST 100 Mbps Ethernet communication module (optional)

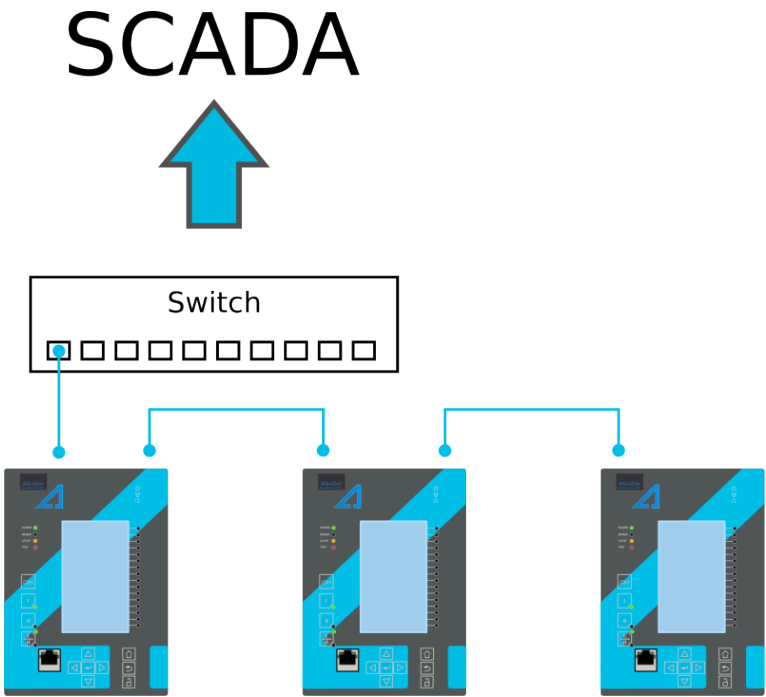

Figure. 7.4.7 - 189. Double ST 100 Mbps Ethernet communication module connectors.

Connector	Description
Two-pin connector	<ul style="list-style-type: none">• IRIG-B input
ST connectors	<ul style="list-style-type: none">• Duplex ST connectors• 62.5/125 μm or 50/125 μm multimode fiber• Transmitter wavelength: 1260...1360 nm (nominal: 1310 nm)• Receiver wavelength: 1100...1600 nm• 100BASE-FX• Up to 2 km

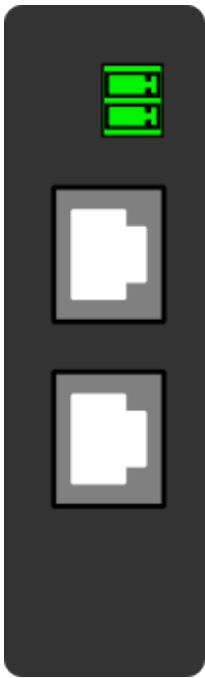

This option cards supports redundant ring configuration and multidrop configurations. Please note that each ring can only contain AQ-200 series devices, and any third party devices must be connected to a separate ring.

Figure. 7.4.7 - 190. Example of a multidrop configuration.

7.4.8 Double RJ45 10/100 Mbps Ethernet communication module (optional)

Figure. 7.4.8 - 191. Double RJ-45 10/100 Mbps Ethernet communication module.

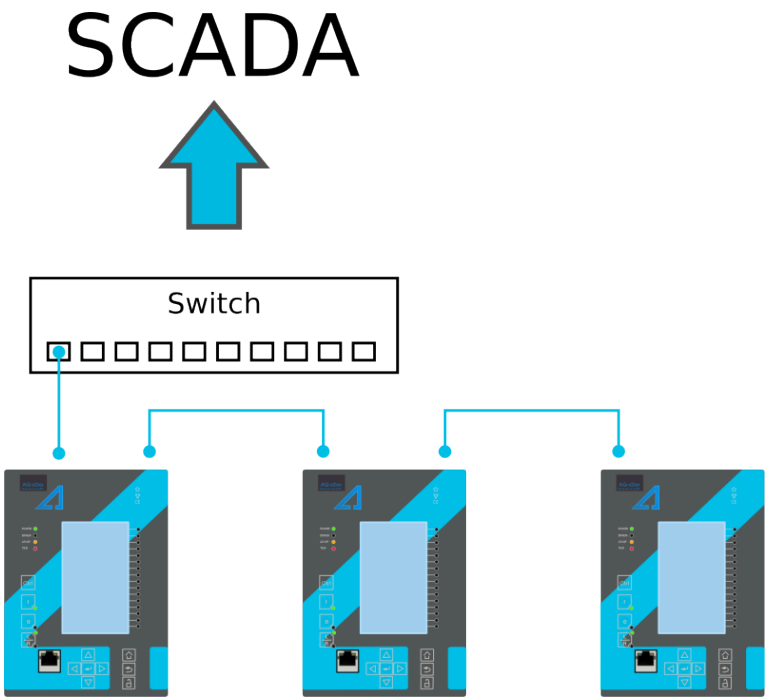

Connector	Description
Two-pin connector	<ul style="list-style-type: none">IRIG-B input

Connector	Description
RJ-45 connectors	<ul style="list-style-type: none">• Two Ethernet ports• RJ-45 connectors• 10BASE-T and 100BASE-TX

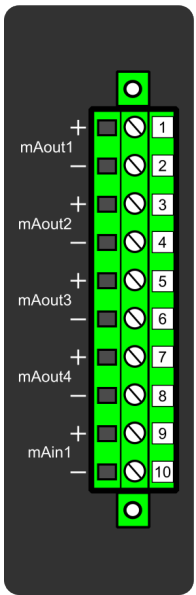

This option card supports multidrop configurations.

Figure. 7.4.8 - 192. Example of a multidrop configuration.

7.4.9 Milliampere output (mA) I/O module (optional)

Figure. 7.4.9 - 193. Milliampere output (mA) I/O module connections.

Connector	Description
Pin 1	mA OUT 1 + connector (0...24 mA)
Pin 2	mA OUT 1 – connector (0...24 mA)
Pin 3	mA OUT 2 + connector (0...24 mA)
Pin 4	mA OUT 2 – connector (0...24 mA)
Pin 5	mA OUT 3 + connector (0...24 mA)
Pin 6	mA OUT 3 – connector (0...24 mA)
Pin 7	mA OUT 4 + connector (0...24 mA)
Pin 8	mA OUT 4 – connector (0...24 mA)
Pin 9	mA IN 1 + connector (0...33 mA)
Pin 10	mA IN 1 – connector (0...33 mA)

The milliamper (mA) I/O module is an add-on module with four (4) mA outputs and one (1) mA input. Both the outputs and the input are in two galvanically isolated groups, with one pin for the positive (+) connector and one pin for the negative (–) connector.

This module can be ordered directly to be installed into the device in the factory, or it can be upgraded in the field after the device's original installation when required.

The user sets the mA I/O with the mA outputs control function. This can be done at *Control* → *Device I/O* → *mA outputs* in the device configuration settings.

7.5 Dimensions and installation

The device can be installed either to a standard 19" rack or to a switchgear panel with cutouts. The desired installation type is defined in the order code. When installing to a rack, the device takes a quarter ($\frac{1}{4}$) of the rack's width, meaning that a total of three devices can be installed to the same rack next to one another.

The figures below describe the device dimensions (first figure), the device installation (second), and the panel cutout dimensions and device spacing (third).

Figure. 7.5 - 194. Device dimensions.

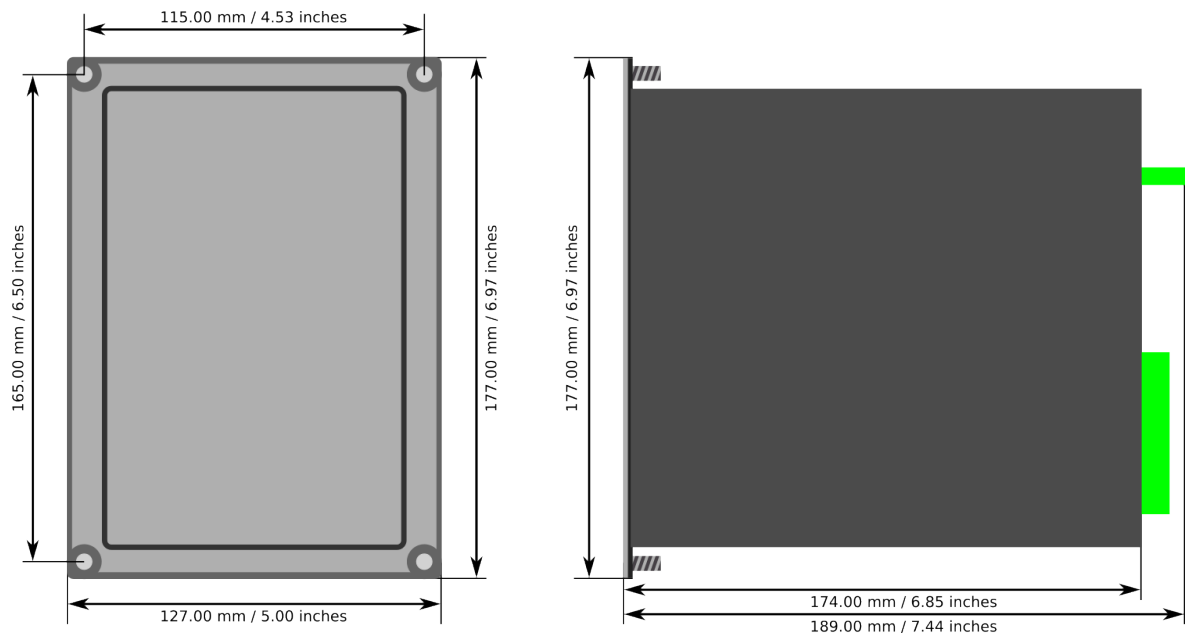

Figure. 7.5 - 195. Device installation.

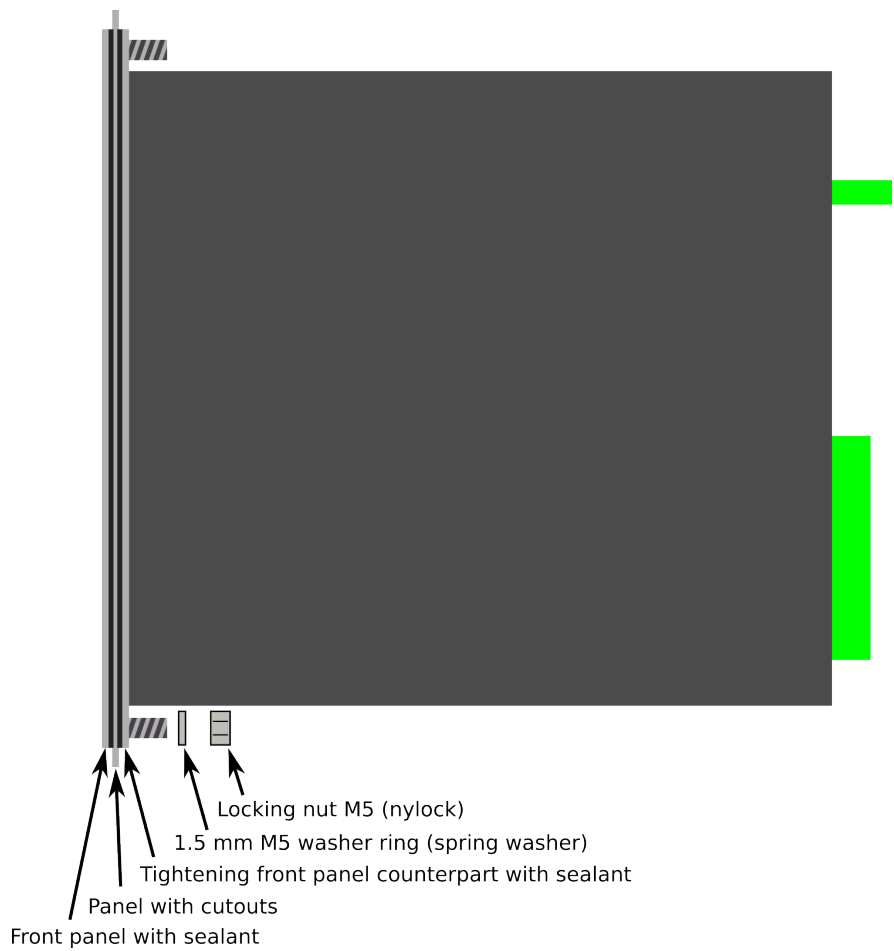

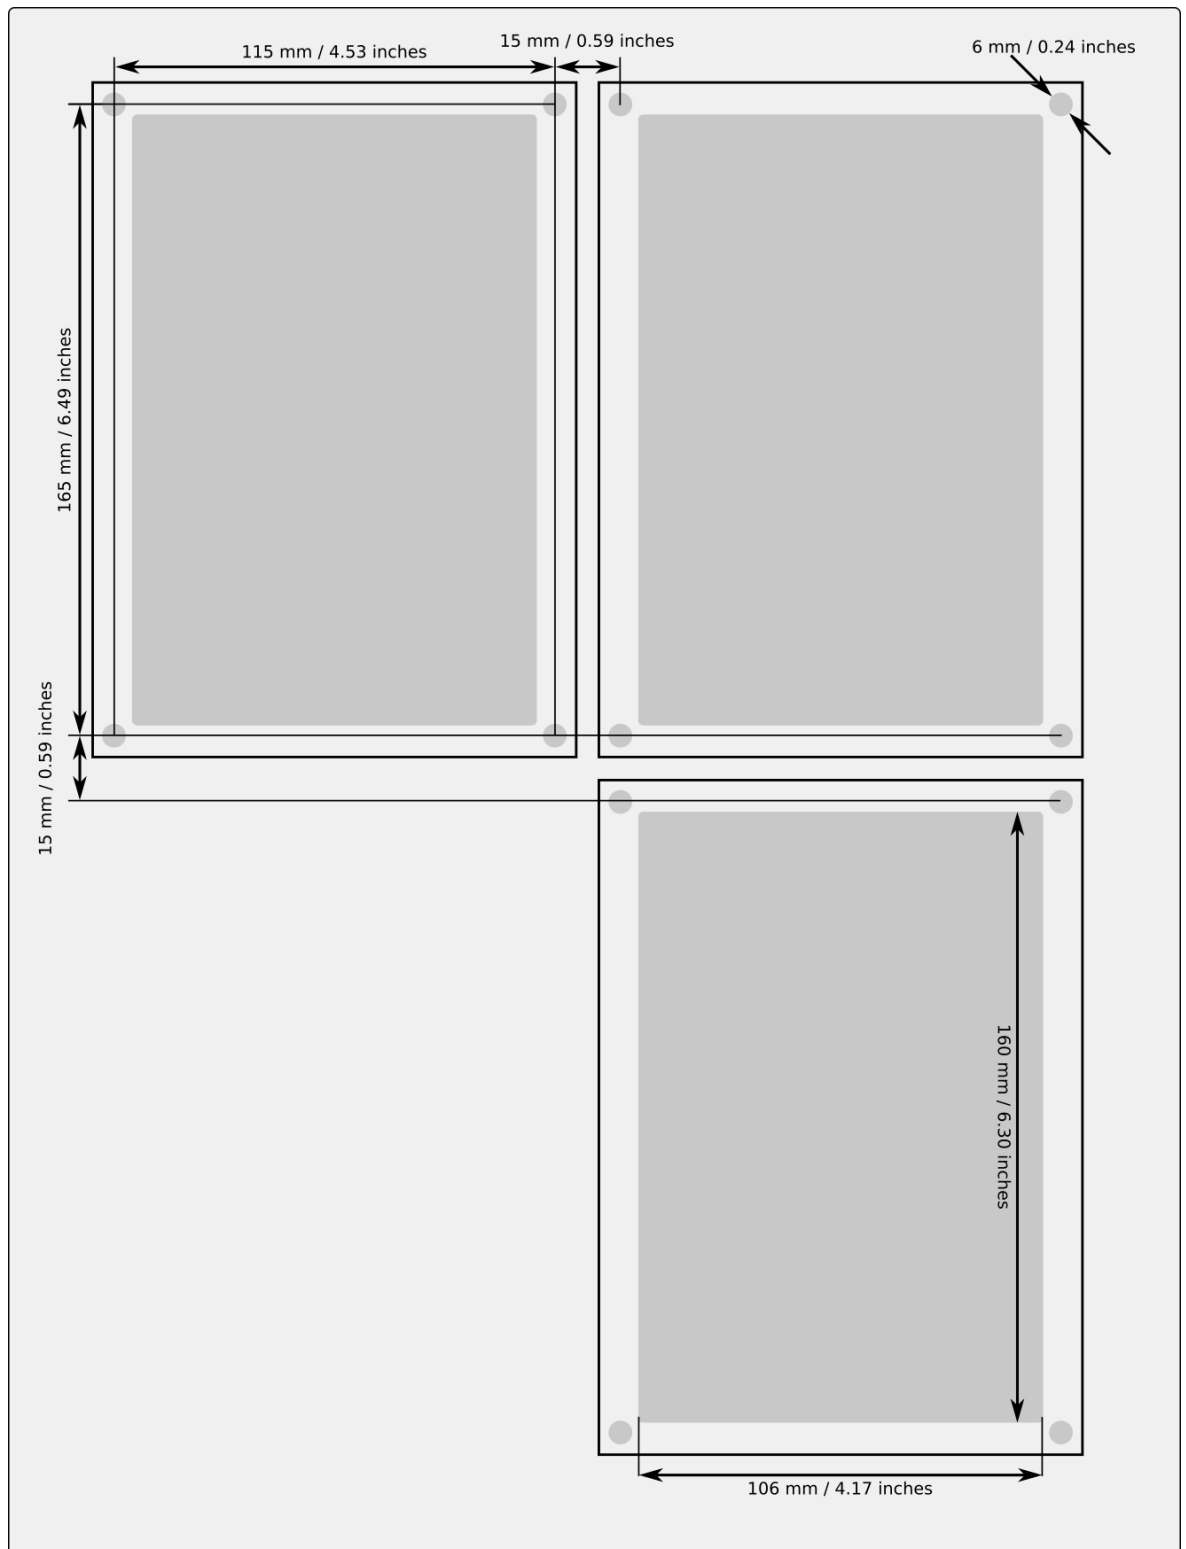

Figure. 7.5 - 196. Panel cutout dimensions and device spacing.

8 Technical data

8.1 Hardware

8.1.1 Measurements

8.1.1.1 Current measurement

Table. 8.1.1.1 - 225. Technical data for the current measurement module.

General information	
Spare part code	#SP-2XX-CM
Compatibility	AQ-210 and AQ-250 series models
Connections	
Measurement channels/CT inputs	Three phase current inputs: IL1 (A), IL2 (B), IL3 (C) Two residual current inputs: Coarse residual current input I01, Fine residual current input I02
Phase current inputs (A, B, C)	
Sample rate	64 samples per cycle in frequency range 6...75Hz
Rated current I_N	5 A (configurable 0.2...20 A)
Thermal withstand	20 A (continuous) 100 A (for 10 s) 500 A (for 1 s) 1250 A (for 0.01 s)
Frequency measurement range	From 6...75Hz fundamental, up to the 31 st harmonic current
Current measurement range	25 mA...250 A (RMS)
Current measurement inaccuracy	$0.005...4.000 \times I_N < \pm 0.5 \%$ or $< \pm 15 \text{ mA}$ $4...20 \times I_N < \pm 0.5 \%$ $20...50 \times I_N < \pm 1.0 \%$
Angle measurement inaccuracy	$< \pm 0.2^\circ$ ($I > 0.1 \text{ A}$) $< \pm 1.0^\circ$ ($I \leq 0.1 \text{ A}$)
Burden (50/60 Hz)	$< 0.1 \text{ VA}$
Transient overreach	$< 8 \%$
Coarse residual current input (I01)	
Rated current I_N	1 A (configurable 0.1...10 A)

Thermal withstand	25 A (continuous) 100 A (for 10 s) 500 A (for 1 s) 1250 A (for 0.01 s)
Frequency measurement range	From 6...75 Hz fundamental, up to the 31 st harmonic current
Current measurement range	5 mA...150 A (RMS)
Current measurement inaccuracy	$0.002...10.000 \times I_N < \pm 0.5 \%$ or $< \pm 3 \text{ mA}$ $10...150 \times I_N < \pm 0.5 \%$
Angle measurement inaccuracy	$< \pm 0.2^\circ$ ($I > 0.05 \text{ A}$) $< \pm 1.0^\circ$ ($I \leq 0.05 \text{ A}$)
Burden (50/60Hz)	$< 0.1 \text{ VA}$
Transient overreach	$< 5 \%$
Fine residual current input (I02)	
Rated current I_N	0.2 A (configurable 0.001...10 A)
Thermal withstand	25 A (continuous) 100 A (for 10 s) 500 A (for 1 s) 1250 A (for 0.01 s)
Frequency measurement range	From 6...75 Hz fundamental, up to the 31 st harmonic current
Current measurement range	1 mA...75 A (RMS)
Current measurement inaccuracy	$0.002...25.000 \times I_N < \pm 0.5 \%$ or $< \pm 0.6 \text{ mA}$ $25...375 \times I_N < \pm 1.0 \%$
Angle measurement inaccuracy	$< \pm 0.2^\circ$ ($I > 0.01 \text{ A}$) $< \pm 1.0^\circ$ ($I \leq 0.01 \text{ A}$)
Burden (50/60Hz)	$< 0.1 \text{ VA}$
Transient overreach	$< 5 \%$
Screw connection terminal block (standard)	
Terminal block	Phoenix Contact FRONT 4-H-6,35
Solid or stranded wire Nominal cross section	4 mm ²
Ring lug terminal block connection (option)	
Ring terminal dimensions	Max 8mm diameter, with minimum 3,5mm screw hole

NOTICE!

Current measurement accuracy has been verified with 50/60 Hz.

The amplitude difference is 0.2 % and the angle difference is 0.5 degrees higher at 16.67 Hz and other frequencies.

8.1.1.2 Frequency measurement

Table. 8.1.1.2 - 226. Frequency measurement accuracy.

Frequency measurement performance	
Frequency measuring range	6...75 Hz fundamental, up to the 31 st harmonic current or voltage
Inaccuracy	<1 mHz

8.1.2 CPU & Power supply

Table. 8.1.2 - 227. General information for the CPU module.

General information	
Spare part code	#SP-200-CPU
Compatibility	AQ-200 series models
Terminal block connection	
Screw connection terminal block (standard)	Phoenix Contact MSTB 2,5/5-ST-5,08
Spring cage terminal block (option)	Phoenix Contact FKC 2,5/20-STF-5,08
Solid or stranded wire Nominal cross section	2.5 mm ²
RS-485 serial terminal block connection	
Screw connection terminal block (standard)	Phoenix Contact MC 1,5/ 5-ST-3,81
Spring cage terminal block (option)	Phoenix Contact FK-MCP 1,5/ 5-ST-3,81
Solid or stranded wire Nominal cross section	1.5 mm ²

8.1.2.1 Auxiliary voltage

Table. 8.1.2.1 - 228. Power supply model A

Rated values	
Rated auxiliary voltage	80...265 V (AC/DC)
Power consumption	< 7 W (no option cards) < 15 W (maximum number of option cards)
Maximum permitted interrupt time	< 60 ms with 110 VDC
DC ripple	< 15 %
Other	
Minimum recommended fuse rating	MCB C2

Table. 8.1.2.1 - 229. Power supply model B

Rated values	
Rated auxiliary voltage	18...72 VDC
Power consumption	< 7 W (no option cards) < 15 W (maximum number of option cards)
Maximum permitted interrupt time	< 90 ms with 24 VDC
DC ripple	< 15 %
Other	
Minimum recommended fuse rating	MCB C2

8.1.2.2 CPU communication ports

Table. 8.1.2.2 - 230. Front panel local communication port.

Port	
Port media	Copper Ethernet RJ-45
Number of ports	1
Port protocols	PC-protocols FTP Telnet
Features	
Data transfer rate	100 MB/s
System integration	Can't be used for system protocols, only for local programming

Table. 8.1.2.2 - 231. Rear panel system communication port A.

Port	
Port media	Copper Ethernet RJ-45
Number of ports	1
Features	
Port protocols	IEC 61850 IEC 104 Modbus/TCP DNP3 FTP Telnet
Data transfer rate	100 MB/s
System integration	Can be used for system protocols and for local programming

Table. 8.1.2.2 - 232. Rear panel system communication port B.

Port	
Port media	Copper RS-485
Number of ports	1
Features	
Port protocols	Modbus/RTU IEC 103 IEC 101 DNP3 SPA
Data transfer rate	65 580 kB/s
System integration	Can be used for system protocols

8.1.2.3 CPU digital inputs

Table. 8.1.2.3 - 233. CPU model-isolated digital inputs, with thresholds defined by order code.

Rated values	
Rated auxiliary voltage	265 V (AC/DC)
Nominal voltage	Order code defined: 24, 110, 220 V (AC/DC)
Pick-up threshold Release threshold	Order code defined: 19, 90, 170 V Order code defined: 14, 65, 132 V
Scanning rate	5 ms
Settings	
Pick-up delay	Software settable: 0...1800 s
Polarity	Software settable: Normally On/Normally Off
Current drain	2 mA

8.1.2.4 CPU digital outputs

Table. 8.1.2.4 - 234. Digital outputs (Normally Open)

Rated values	
Rated auxiliary voltage	265 V (AC/DC)
Continuous carry	5 A
Make and carry 0.5 s Make and carry 3 s	30 A 15 A

Breaking capacity, DC (L/R = 40 ms) at 48 VDC at 110 VDC at 220 VDC	1 A 0.4 A 0.2 A
Control rate	5 ms
Settings	
Polarity	Software settable: Normally Open / Normally Closed

Table. 8.1.2.4 - 235. Digital outputs (Change-Over)

Rated values	
Rated auxiliary voltage	265 V (AC/DC)
Continuous carry	2.5 A
Make and carry 0.5 s Make and carry 3 s	30 A 15 A
Breaking capacity, DC (L/R = 40 ms) at 48 VDC at 110 VDC at 220 VDC	1 A 0.3 A 0.15 A
Control rate	5 ms
Settings	
Polarity	Software settable: Normally Open / Normally Closed

CAUTION!

Please note, that signaling relay 5 and system fault's signaling relay are designed only for signaling purposes, and are not to be used in trip coil control.

8.1.3 Option cards

8.1.3.1 Digital input module

Table. 8.1.3.1 - 236. Technical data for the digital input module.

General information	
Spare part code	#SP-200-DI8
Compatibility	AQ-200 series models
Rated values	
Rated auxiliary voltage	5...265 V (AC/DC)
Current drain	2 mA

Scanning rate Activation/release delay	5 ms 5...11 ms
Settings	
Pick-up threshold Release threshold	Software settable: 16...200 V, setting step 1 V Software settable: 10...200 V, setting step 1 V
Pick-up delay	Software settable: 0...1800 s
Drop-off delay	Software settable: 0...1800 s
Polarity	Software settable: Normally On/Normally Off
Terminal block connection	
Screw connection terminal block (standard)	Phoenix Contact MSTB 2,5/10-ST-5,08
Spring cage terminals block (option)	Phoenix Contact FKC 2,5/10-STF-5,08
Solid or stranded wire Nominal cross section	2.5 mm ²

8.1.3.2 Digital output module

Table. 8.1.3.2 - 237. Technical data for the digital output module.

General information	
Spare part code	#SP-200-DO5
Compatibility	AQ-200 series models
Rated values	
Rated auxiliary voltage	265 V (AC/DC)
Continuous carry	5 A
Make and carry 0.5 s Make and carry 3 s	30 A 15 A
Breaking capacity, DC (L/R = 40 ms) at 48 VDC at 110 VDC at 220 VDC	1 A 0.4 A 0.2 A
Control rate	5 ms
Settings	
Polarity	Software settable: Normally On/Normally Off
Terminal block connection	
Screw connection terminal block (standard)	Phoenix Contact MSTB 2,5/10-ST-5,08
Spring cage terminals block (option)	Phoenix Contact FKC 2,5/10-STF-5,08

Solid or stranded wire Nominal cross section	2.5 mm ²
---	---------------------

8.1.3.3 Point sensor arc protection module

Table. 8.1.3.3 - 238. Technical data for the point sensor arc protection module.

General information	
Spare part code	#SP-2XX-ARC
Compatibility	AQ-200 series & AQ-250 series models
Connections	
Input arc point sensor channels	S1, S2, S3, S4 (pressure and light, or light only)
Sensors per channel	3
Maximum cable length	200 m
Performance	
Pick-up light intensity	8, 25 or 50 kLx (the sensor is selectable in the order code)
Point sensor detection radius	180 degrees
Start and instant operating time (light only)	Typically <5 ms with dedicated semiconductor outputs (HSO) Typically <10 ms regular output relays

Table. 8.1.3.3 - 239. High-Speed Outputs (HSO1...2)

Rated values	
Rated auxiliary voltage	250 VDC
Continuous carry	2 A
Make and carry 0.5 s Make and carry 3 s	15 A 6 A
Breaking capacity, DC (L/R = 40 ms)	1 A/110 W
Control rate	5 ms
Operation delay	<1 ms
Polarity	Normally Off
Contact material	Semiconductor

Table. 8.1.3.3 - 240. Binary input channel

Rated values	
Voltage withstand	265 VDC

Nominal voltage Pick-up threshold Release threshold	24 VDC ≥16 VDC ≤15 VDC
Scanning rate	5 ms
Polarity	Normally Off
Current drain	3 mA

Table. 8.1.3.3 - 241. Terminal block connections

Arc point sensor terminal block connections	
Spring cage terminal block	Phoenix Contact DFMC 1,5/ 6-STF-3,5
Solid or stranded wire Nominal cross section	1.5 mm ²
Binary input and HSO terminal block connections	
Screw connection terminal block (standard)	Phoenix Contact MSTB 2,5/5-ST-5,08
Spring cage terminals block (option)	Phoenix Contact FKC 2,5/10-STF-5,08
Solid or stranded wire Nominal cross section	2.5 mm ²

**NOTICE!**

The polarity must be correct!

8.1.3.4 Milliampere output module (mA out & mA in)

Table. 8.1.3.4 - 242. Technical data for the milliampere output module.

General information	
Spare part code	#SP-2XX-MA
Compatibility	AQ-200 series & AQ-250 series models
Signals	
Output magnitudes Input magnitudes	4 × mA output signal (DC) 1 × mA input signal (DC)
mA input	
Range (hardware) Range (measurement) Inaccuracy	0...33 mA 0...24 mA ±0.1 mA
Update cycle Response time @ 5 ms cycle Update cycle time inaccuracy	5...10 000 ms, setting step 5 ms ~ 15 ms (13...18 ms) Max. +20 ms above the set cycle

mA input scaling range	0...4000 mA
Output scaling range	-1 000 000.0000...1 000 000.0000, setting step 0.0001
mA output	
Inaccuracy @ 0...24 mA	±0.01 mA
Response time @ 5 ms cycle [fixed]	< 5 ms
mA output scaling range	0...24 mA, setting step 0.001 mA
Source signal scaling range	-1 000 000.000...1 000 000.0000, setting step 0.0001
Terminal block connection	
Screw connection terminal block (standard)	Phoenix Contact MSTB 2,5/10-ST-5,08
Spring cage terminals block (option)	Phoenix Contact FKC 2,5/10-STF-5,08
Solid or stranded wire	2.5 mm ²
Nominal cross section	

8.1.3.5 RTD input module

Table. 8.1.3.5 - 243. Technical data for the RTD input module.

General information	
Spare part code	#SP-2xx-RTD
Compatibility	AQ-200 series & AQ-250 series models
Channels 1-8	
2/3/4-wire RTD	
Pt100 or Pt1000	
Terminal block connection	
Spring cage terminals block	Phoenix Contact DFMC 1,5/ 16-STF-3,5
Solid or stranded wire	1.5 mm ²
Nominal cross section	

8.1.3.6 RS-232 & serial fiber communication module

Table. 8.1.3.6 - 244. Technical data for the RS-232 & serial fiber communication module.

General information	
PP Spare part code	#SP-2XX-232PP
PG Spare part code	#SP-2XX-232PG
GP Spare part code	#SP-2XX-232GP
GG Spare part code	#SP-2XX-232GG

Compatibility	AQ-200 series & AQ-250 series models
Serial fiber connections	
Connection types	<ul style="list-style-type: none"> • Plastic - Plastic • Plastic - Glass • Glass - Plastic • Glass - Glass
Wavelength	660 nm
Cable type	1 mm plastic fiber
RS-232 terminal block connections	
Spring cage terminals block	Phoenix Contact DFMC 1,5/ 6-STF-3,5
Solid or stranded wire Nominal cross section	1.5 mm ²

8.1.3.7 Double LC 100 Mbps Ethernet communication module

Table. 8.1.3.7 - 245. Technical data for the double LC 100 Mbps Ethernet communication module.

General information	
Spare part code	#SP-2XX-2XLC
Compatibility	AQ-200 series & AQ-250 series models
Protocols	
Protocols	HSR and PRP
Ports	
Quantity of fiber ports	2
Communication port C & D	LC fiber connector Wavelength 1300 nm
Fiber cable	50/125 µm or 62.5/125 µm multimode (glass)

8.1.3.8 Double ST 100 Mbps Ethernet communication module

Table. 8.1.3.8 - 246. Technical data for the double ST 100 Mbps Ethernet communication module.

General information	
Spare part code	#SP-2XX-2XST
Compatibility	AQ-200 series & AQ-250 series models
Dimensions	74 mm X 179 mm
Ports	ST connectors (2) and IRIG-B connector (1)

Protocols	
Protocols	IEC61850, DNP/TCP, Modbus/TCP, IEC104 & FTP
ST connectors	
Connector type	Duplex ST connectors 62.5/125 µm or 50/125 µm multimode fiber 100BASE-FX
Transmitter wavelength	1260...1360 nm (nominal: 1310 nm)
Receiver wavelength	1100...1600 nm
Maximum distance	2 km
IRIG-B Connector	
Screw connection terminal block	Phoenix Contact MC 1,5/ 2-ST-3,5 BD:1-2
Solid or stranded wire Nominal cross section	1.5 mm ²

8.1.4 Display

Table. 8.1.4 - 247. Technical data for the HMI LCD display.

General information	
Spare part code	#SP-200-DISP
Compatibility	AQ-200 series models
Dimensions and resolution	
Number of dots/resolution	320 x 160
Size	84.78 × 49.90 mm (3.34 × 1.96 in)
Display	
Type of display	LCD
Color	Monochrome

8.2 Functions

8.2.1 Protection functions

8.2.1.1 Non-directional overcurrent protection (I>; 50/51)

Table. 8.2.1.1 - 248. Technical data for the non-directional overcurrent function.

Measurement inputs

Current inputs	Phase current inputs: I_{L1} (A), I_{L2} (B), I_{L3} (C)
Current input magnitudes	RMS phase currents TRMS phase currents Peak-to-peak phase currents
Pick-up	
Pick-up current setting	$0.10 \dots 50.00 \times I_n$, setting step $0.01 \times I_n$
Inrush 2nd harmonic blocking	$0.10 \dots 50.00 \% I_{fund}$, setting step $0.01 \% I_{fund}$
Inaccuracy: - Current - 2 nd harmonic blocking	$\pm 0.5 \% I_{set}$ or $\pm 15 \text{ mA}$ ($0.10 \dots 4.0 \times I_{set}$) $\pm 1.0 \%$ -unit of the 2 nd harmonic setting
Operation time	
Definite time function operating time setting	$0.000 \dots 1800.000 \text{ s}$, setting step 0.005 s
Inaccuracy: - Definite time: I_m/I_{set} ratio > 3 - Definite time: I_m/I_{set} ratio = $1.05 \dots 3$	$\pm 1.0 \%$ or $\pm 20 \text{ ms}$ $\pm 1.0 \%$ or $\pm 30 \text{ ms}$
IDMT setting parameters: - k Time dial setting for IDMT - A IDMT constant - B IDMT constant - C IDMT constant	$0.01 \dots 25.00$, step 0.01 $0 \dots 250.0000$, step 0.0001 $0 \dots 250.0000$, step 0.0001 $0 \dots 250.0000$, step 0.0001
Inaccuracy: - IDMT operating time - IDMT minimum operating time	$\pm 1.5 \%$ or $\pm 20 \text{ ms}$ $\pm 20 \text{ ms}$
Retardation time (overshoot)	$< 30 \text{ ms}$
Instant operation time	
Start time and instant operation time (trip): - I_m/I_{set} ratio > 3 - I_m/I_{set} ratio = $1.05 \dots 3$	$< 35 \text{ ms}$ (typically 25 ms) $< 50 \text{ ms}$
Reset	
Reset ratio	97 % of the pick-up current setting
Reset time setting Inaccuracy: Reset time	$0.000 \dots 150.000 \text{ s}$, step 0.005 s $\pm 1.0 \%$ or $\pm 50 \text{ ms}$
Instant reset time and start-up reset	$< 50 \text{ ms}$

**NOTICE!**The release delay does not apply to phase-specific tripping!

8.2.1.2 Non-directional earth fault protection ($I_0 >$; 50N/51N)

Table. 8.2.1.2 - 249. Technical data for the non-directional earth fault function.

Measurement inputs	
Current input (selectable)	Residual current channel I_{01} (Coarse) Residual current channel I_{02} (Fine) Calculated residual current: I_{L1} (A), I_{L2} (B), I_{L3} (C)
Current input magnitudes	RMS residual current (I_{01} , I_{02} or calculated I_0) TRMS residual current (I_{01} or I_{02}) Peak-to-peak residual current (I_{01} or I_{02})
Pick-up	
Used magnitude	Measured residual current I_{01} (1 A) Measured residual current I_{02} (0.2 A) Calculated residual current I_{0Calc} (5 A)
Pick-up current setting	$0.0001 \dots 40.00 \times I_n$, setting step $0.0001 \times I_n$
Inaccuracy: - Starting I_{01} (1 A) - Starting I_{02} (0.2 A) - Starting I_{0Calc} (5 A)	$\pm 0.5 \% I_{0set}$ or ± 3 mA ($0.005 \dots 10.0 \times I_{set}$) $\pm 1.5 \% I_{0set}$ or ± 1.0 mA ($0.005 \dots 25.0 \times I_{set}$) $\pm 1.0 \% I_{0set}$ or ± 15 mA ($0.005 \dots 4.0 \times I_{set}$)
Operating time	
Definite time function operating time setting	$0.000 \dots 1800.000$ s, setting step 0.005 s
Inaccuracy: - Definite time: I_m/I_{set} ratio > 3 - Definite time: I_m/I_{set} ratio = $1.05 \dots 3$	$\pm 1.0 \%$ or ± 20 ms $\pm 1.0 \%$ or ± 30 ms
IDMT setting parameters: - k Time dial setting for IDMT - A, B, C IDMT constants	$0.01 \dots 25.00$, step 0.01 $0 \dots 250.0000$, step 0.0001
Inaccuracy: - IDMT operating time - IDMT minimum operating time	$\pm 1.5 \%$ or ± 20 ms ± 20 ms
Retardation time (overshoot)	< 30 ms
Instant operation time	
Start time and instant operation time (trip): - I_m/I_{set} ratio > 3.5 - I_m/I_{set} ratio = $1.05 \dots 3.5$	< 50 ms (typically 35 ms) < 55 ms
Reset	
Reset ratio	97 % of the pick-up current setting
Reset time setting Inaccuracy: Reset time	$0.000 \dots 150.000$ s, step 0.005 s $\pm 1.0 \%$ or ± 50 ms
Instant reset time and start-up reset	< 50 ms

**NOTICE!**

The operation and reset time accuracy does **not** apply when the measured secondary current in I02 is 1...20 mA. The pick-up is tuned to be more sensitive and the operation times vary because of this.

8.2.1.3 Negative sequence overcurrent/ phase current reversal/ current unbalance protection (I2>; 46/46R/46L)

Table. 8.2.1.3 - 250. Technical data for the current unbalance function.

Measurement inputs	
Current inputs	Phase current inputs: I _{L1} (A), I _{L2} (B), I _{L3} (C)
Current input calculations	Positive sequence current (I ₁) Negative sequence current (I ₂)
Pick-up	
Used magnitude	Negative sequence component I _{2pu} Relative unbalance I ₂ /I ₁
Pick-up setting	0.01...40.00 × I _n , setting step 0.01 × I _n (I _{2pu}) 1.00...200.00 %, setting step 0.01 % (I ₂ /I ₁)
Minimum phase current (at least one phase above)	0.01...2.00 × I _n , setting step 0.01 × I _n
Inaccuracy: - Starting I _{2pu} - Starting I ₂ /I ₁	±1.0 %-unit or ±100 mA (0.10...4.0 × I _n) ±1.0 %-unit or ±100 mA (0.10...4.0 × I _n)
Operating time	
Definite time function operating time setting	0.000...1800.000 s, setting step 0.005 s
Inaccuracy: - Definite time (I _m /I _{set} ratio > 1.05)	±1.5 % or ±60 ms
IDMT setting parameters: - k Time dial setting for IDMT - A IDMT Constant - B IDMT Constant - C IDMT Constant	0.01...25.00, step 0.01 0...250.0000, step 0.0001 0...250.0000, step 0.0001 0...250.0000, step 0.0001
Inaccuracy: - IDMT operating time - IDMT minimum operating time	±2.0 % or ±30 ms ±20 ms
Retardation time (overshoot)	<5 ms
Instant operation time	
Start time and instant operation time (trip): - I _m /I _{set} ratio > 1.05	<70 ms
Reset	
Reset ratio	97 % of the pick-up setting

Reset time setting Inaccuracy: Reset time	0.000...150.000 s, step 0.005 s ±1.5 % or ±60 ms
Instant reset time and start-up reset	<55 ms

8.2.1.4 Harmonic overcurrent protection (I_h ; 50H/51H/68H)

Table. 8.2.1.4 - 251. Technical data for the harmonic overcurrent function.

Measurement inputs	
Current inputs	Phase current inputs: I_{L1} (A), I_{L2} (B), I_{L3} (C) Residual current channel I_{01} (Coarse) Residual current channel I_{02} (Fine)
Pick-up	
Harmonic selection	2 nd , 3 rd , 4 th , 5 th , 6 th , 7 th , 9 th , 11 th , 13 th , 15 th , 17 th or 19 th
Used magnitude	Harmonic per unit ($\times I_N$) Harmonic relative (I_h/I_L)
Pick-up setting	0.05...2.00 $\times I_N$, setting step 0.01 $\times I_N$ ($\times I_N$) 5.00...200.00 %, setting step 0.01 % (I_h/I_L)
Inaccuracy: - Starting $\times I_N$ - Starting $\times I_h/I_L$	<0.03 $\times I_N$ (2 nd , 3 rd , 5 th) <0.03 $\times I_N$ tolerance to I_h (2 nd , 3 rd , 5 th)
Operation time	
Definite time function operating time setting	0.000...1800.000 s, setting step 0.005 s
Inaccuracy: - Definite time (I_M/I_{SET} ratio >1.05)	±1.0 % or ±35 ms
IDMT setting parameters: k Time dial setting for IDMT A IDMT constant B IDMT constant C IDMT constant	0.01...25.00, step 0.01 0...250.0000, step 0.0001 0...250.0000, step 0.0001 0...250.0000, step 0.0001
Inaccuracy: - IDMT operating time - IDMT minimum operating time	±1.5 % or ±20 ms ±20 ms
Instant operation time	
Start time and instant operation time (trip): I_M/I_{SET} ratio >1.05	<50 ms
Reset	
Reset ratio	95 % of the pick-up setting
Reset time setting Inaccuracy: Reset time	0.000...150.000 s, step 0.005 s ±1.0 % or ±35 ms
Instant reset time and start-up reset	<50 ms

NOTICE!

Harmonics generally: The amplitude of the harmonic content **must** be least $0.02 \times I_N$ when the relative mode (Ih/IL) is used!

Blocking: To achieve fast activation for blocking purposes with the harmonic overcurrent stage, note that the harmonic stage may be activated by a rapid load change or fault situation. An intentional activation lasts for approximately 20 ms if a harmonic component is not present. The harmonic stage stays active if the harmonic content is above the pick-up limit.

Tripping: When using the harmonic overcurrent stage for tripping, please ensure that the operation time is set to 20 ms (DT) or longer to avoid nuisance tripping caused by the above-mentioned reasons.

8.2.1.5 Circuit breaker failure protection (CBFP; 50BF/52BF)

Table. 8.2.1.5 - 252. Technical data for the circuit breaker failure protection function.

Measurement inputs	
Current inputs	Phase current inputs: I_{L1} (A), I_{L2} (B), I_{L3} (C) Residual current channel I_{01} (Coarse) Residual current channel I_{02} (Fine)
Current input magnitudes	RMS phase currents RMS residual current (I_{01} , I_{02} or calculated I_0)
Pick-up	
Monitored signals	Digital input status, digital output status, logical signals
Pick-up current setting: - $I_{L1} \dots I_{L3}$ - I_{01} , I_{02} , I_{0Calc}	$0.10 \dots 40.00 \times I_N$, setting step $0.01 \times I_N$ $0.005 \dots 40.00 \times I_N$, setting step $0.005 \times I_N$
Inaccuracy: - Starting phase current (5A) - Starting I_{01} (1 A) - Starting I_{02} (0.2 A) - Starting I_{0Calc} (5 A)	$\pm 0.5 \% I_{SET}$ or $\pm 15 \text{ mA}$ ($0.10 \dots 4.0 \times I_{SET}$) $\pm 0.5 \% I_{0SET}$ or $\pm 3 \text{ mA}$ ($0.005 \dots 10.0 \times I_{SET}$) $\pm 1.5 \% I_{0SET}$ or $\pm 1.0 \text{ mA}$ ($0.005 \dots 25.0 \times I_{SET}$) $\pm 1.0 \% I_{0SET}$ or $\pm 15 \text{ mA}$ ($0.005 \dots 4.0 \times I_{SET}$)
Operation time	
Definite time function operating time setting	$0.050 \dots 1800.000 \text{ s}$, setting step 0.005 s
Inaccuracy: - Current criteria (I_M/I_{SET} ratio $1.05 \rightarrow$) - DO or DI only	$\pm 1.0 \%$ or $\pm 55 \text{ ms}$ $\pm 15 \text{ ms}$
Reset	
Reset ratio	97 % of the pick-up current setting
Reset time	<50 ms

8.2.1.6 Low-impedance or high-impedance restricted earth fault/ cable end differential protection ($I_{0d}>$; 87N)

Table. 8.2.1.6 - 253. Technical data for the restricted earth fault/cable end differential function.

Measurement inputs	
Current inputs	Phase current inputs: I_{L1} (A), I_{L2} (B), I_{L3} (C) Residual current channel I_{01} (Coarse) Residual current channel I_{02} (Fine)
Current input calculations	Calculated bias and residual differential currents
Pick-up	
Operating modes	Restricted earth fault Cable end differential
Characteristics	Biased differential with 3 settable sections and 2 slopes
Pick-up current sensitivity setting Slope 1 Slope 2 Bias (Turnpoint 1 & 2)	0.01...50.00 % (I_N), setting step 0.01 % 0.00...150.00 %, setting step 0.01 % 0.00...250.00 %, setting step 0.01 % 0.01...50.00 $\times I_N$, setting step 0.01 $\times I_N$
Inaccuracy - Starting	$\pm 3\%$ of the set pick-up value $> 0.5 \times I_N$ setting. $\pm 5 \text{ mA} < 0.5 \times I_N$ setting
Operation time	
Instant operation time $1.05 \times I_{SET}$	$< 30 \text{ ms}$
Reset	
Reset ratio	No hysteresis
Reset time	$< 40 \text{ ms}$

8.2.1.7 Transformer thermal overload protection ($TT>$; 49T)

Table. 8.2.1.7 - 254. Technical data for the transformer thermal overload protection function.

Measurement inputs	
Current inputs	Phase current inputs: I_{L1} (A), I_{L2} (B), I_{L3} (C)
Current input magnitudes	TRMS phase currents (up to the 31 st harmonic)
Setting specifications	
Time constants τ	1 heating, 1 cooling
Time constant value	0.0...500.00 min, step 0.1 min
Service factor (maximum overloading)	0.01...5.00 $\times I_N$, step 0.01 $\times I_N$

Thermal model biasing	- Ambient temperature (Set -60.0...500.0 deg, step 0.1 deg, and RTD) - Negative sequence current
Thermal replica temperature estimates	Selectable between °C and °F
Outputs	
- Alarm 1 - Alarm 2 - Thermal trip - Trip delay - Restart inhibit	0...150 %, step 1 % 0...150 %, step 1 % 0...150 %, step 1 % 0.000...3600.000 s, step 0.005 s 0...150 %, step 1 %
Inaccuracy	
- Starting - Operating time	±0.5 % of the set pick-up value ±5 % or ± 500 ms

8.2.1.8 Transformer status monitoring

Table. 8.2.1.8 - 255. Technical data for the transformer status monitoring function.

Features	
Control scale	Common transformer data settings for all functions in the transformer module, the protection logic, the HMI and the I/O.
Settings	Transformer application nominal data
Other features	Status hours counters (normal load, overload, high overload) Transformer status signals Transformer data for functions
Outputs	
Light/no load	$I_M < 0.2 \times I_N$
Inrush HV side detected	$I_M < 0.2 \times I_N \rightarrow I_M > 1.3 \times I_N$
Inrush LV side detected	$I_M < 0.2 \times I_N \rightarrow I_M > 1.3 \times I_N$
Load normal	$I_M > 0.2 \times I_N \dots I_M < 1.0 \times I_N$
Overloading	$I_M > 1.0 \times I_N \dots I_M < 1.3 \times I_N$
High overload	$I_M > 1.3 \times I_N$
Inaccuracy	
Current detection	±3 % of the set pick-up value > $0.5 \times I_N$ setting. 5 mA < $0.5 \times I_N$ setting
Detection time	±0.5 % or ±10 ms

8.2.1.9 Resistance temperature detectors (RTD)

Table. 8.2.1.9 - 256. Technical data of the resistance temperature detectors.

Inputs	
Resistance input magnitudes	Measured temperatures measured by RTD sensors
RTD channels	12 individual RTD channels
Settable alarms	24 alarms available (two per each RTD channel)
Pick-up	
Alarm setting range Inaccuracy Reset ratio	101.00...2000.00 deg, setting step 0.1 deg (either < or > setting) ±3 % of the set pick-up value 97 % of the pick-up setting
Operation	
Operating time	Typically <500 ms

8.2.1.10 Generator/transformer differential protection ($I_{db}>/I_{di}>/I_{0dHV}>/I_{0dLV}>; 87T/87N/87G$)

Table. 8.2.1.10 - 257. Technical data for the transformer differential protection function.

Measurement inputs	
Current inputs (CT1 and CT2 current measurement module)	Phase current inputs: I_{L1} (A), I_{L2} (B), I_{L3} (C) Residual current channel I_{01} (Coarse) Residual current channel I_{02} (Fine) Calculated residual current: I_{L1} (A), I_{L2} (B), I_{L3} (C)
Current input magnitudes	The phase currents of the high-voltage and the low-voltage sides. Residual current measurement for HV/LV REF protection. Phase currents 2 nd and 5 th harmonic measurement.
Characteristics (differential and REF)	
Differential calculation mode Bias calculation mode	Add or subtract (CT direction) Average or maximum (sensitivity)
$I_{db}>$ pick-up Turnpoint 1 Slope 1 Turnpoint 2 Slope 2	0.01...100.00 %, step 0.01 %, default 10.00 % 0.01...50.00 × I_N , step 0.01 × I_N , default 1.00 × I_N 0.01...250.00 %, step 0.01 %, default 10.00 % 0.01...50.00 × I_N , step 0.01 × I_N , default 3.00 × I_N 0.01...250.00 % by step 0.01 %, default 200.00 %
$I_{di}>$ pick-up	200.00...1500.00 %, step 0.01 %, default 600.00 %
Internal harmonic blocking selection	None, 2 nd harmonic, 5 th harmonic, both 2 nd and 5 th harmonic.
2 nd harmonic blocking pick-up	0.01...50.00 %, step 0.01 %, default 15.00 %

5 th harmonic blocking pick-up	0.01...50.00 %, step 0.01 %, default 35.00 %
Inaccuracy: - Differential current - 2 nd harmonic	$\pm 3.0 \% I_{SET}$ or $\pm 75 \text{ mA}$ ($0.10...4.0 \times I_{SET}$) $\pm 1.5 \% I_{SIDE1}$
Instant operation time	
Instant operation time $> 1.05 \times I_{SET}$	$< 40 \text{ ms}$ (Harmonic blocking active)
Instant operation time $> 3.00 \times I_{SET}$	$< 30 \text{ ms}$ (Harmonic blocking active)
Instant operation time $> 3.00 \times I_{SET}$	$\sim 15 \text{ ms}$ (No harmonic blocking)
Reset	
Reset ratio: differential current	97 % of the differential current setting (typically)
Reset time	$< 50 \text{ ms}$

**NOTICE!**

The harmonic current is set and calculated according to the highest amplitude of side 1, 2 or 3 currents ($I_h\%/I_{SIDE1/2/3}$). The harmonic current is calculated individually for each phase.

8.2.1.11 Arc fault protection ($I_{Arc}>/I_{0Arc}>$; 50Arc/50NArc) (optional)

Table. 8.2.1.11 - 258. Technical data for the arc fault protection function.

Measurement inputs	
Current inputs	Phase current inputs: I_{L1} (A), I_{L2} (B), I_{L3} (C) Residual current channel I_{01} (Coarse) Residual current channel I_{02} (Fine)
Current input magnitudes	Sample-based phase current measurement Sample-based residual current measurement
Arc point sensor inputs	Channels S1, S2, S3, S4 (pressure and light sensor, or light-only sensor) Up to three (3) sensors per channel
System frequency operating range	6.00...75.00 Hz
Pick-up	
Pick-up current setting (phase current) Pick-up current setting (residual current) Pick-up light intensity	$0.05...40.00 \times I_N$, setting step $0.01 \times I_N$ $0.05...40.00 \times I_N$, setting step $0.01 \times I_N$ 8, 25 or 50 kLx (the sensor is selected in the order code)
Starting inaccuracy ($I_{Arc}>$ and $I_{0Arc}>$)	$\pm 3 \%$ of the set pick-up value $> 0.5 \times I_N$ setting. $5 \text{ mA} < 0.5 \times I_N$ setting.
Point sensor detection radius	180 degrees
Operation time	

Light only: - Semiconductor outputs HSO1 and HSO2 - Regular relay outputs	Typically 7 ms (3...12 ms) Typically 10 ms (6.5...15 ms)
Light + current criteria (zone 1...4): - Semiconductor outputs HSO1 and HSO2 - Regular relay outputs	Typically 10 ms (6.5...14 ms) Typically 14 ms (10...18 ms)
Arc BI only: - Semiconductor outputs HSO1 and HSO2 - Regular relay outputs	Typically 7 ms (2...12 ms) Typically 10 ms (6.5...15 ms)

8.2.2 Control functions

8.2.2.1 Setting group selection

Table. 8.2.2.1 - 259. Technical data for the setting group selection function.

Settings and control modes	
Setting groups	8 independent, control-prioritized setting groups
Control scale	Common for all installed functions which support setting groups
Control mode	
Local	Any binary signal available in the device
Remote	Force change overrule of local controls either from the setting tool, HMI or SCADA
Operation time	
Reaction time	<5 ms from receiving the control signal

8.2.2.2 Object control and monitoring

Table. 8.2.2.2 - 260. Technical data for the object control and monitoring function.

General	
Number of objects	5
Supported object types	Circuit breaker Circuit breaker with withdrawable cart Disconnecter (MC) Disconnecter (GND)
Signals	
Input signals	Digital inputs Software signals
Output signals	Close command output Open command output

Operation time	
Breaker traverse time setting	0.02...500.00 s, setting step 0.02 s
Max. close/open command pulse length	0.02...500.00 s, setting step 0.02 s
Control termination time out setting	0.02...500.00 s, setting step 0.02 s
Inaccuracy: - Definite time operating time	±0.5 % or ±10 ms
Breaker control operation time	
External object control time	<75 ms
Object control during auto-reclosing	See the technical sheet for the auto-reclosing function.

8.2.2.3 Indicator object monitoring

Table. 8.2.2.3 - 261. Technical data for the indicator object monitoring function.

General	
Number of objects	5
Supported object types	Disconnecter (GND)
Signals	
Input signals	Digital inputs Software signals

8.2.2.4 Cold load pick-up (CLPU)

Table. 8.2.2.4 - 262. Technical data for the cold load pick-up function.

Measurement inputs	
Current inputs	Phase current inputs: I_{L1} (A), I_{L2} (B), I_{L3} (C)
Current input magnitudes	RMS phase currents
Pick-up	
Pick-up current setting - $I_{LOW}/I_{HIGH}/I_{OVER}$	$0.01...40.00 \times I_N$, setting step $0.01 \times I_N$
Reset ratio	97 % of the pick-up current setting
Inaccuracy: - Current	$\pm 0.5 \% I_{SET}$ or ± 15 mA ($0.10...4.0 \times I_{SET}$)
Operation time	

Definite time function operating time settings: - tSET - tMAX - tMIN	0.000...1800.000 s, setting step 0.005 s 0.000...1800.000 s, setting step 0.005 s 0.000...1800.000 s, setting step 0.005 s
Inaccuracy: - Definite time (I_M/I_{SET} ratio = 1.05/0.95)	±1.0 % or ±45 ms
Instant operation time	
CLPU activation and release	<45 ms (measured from the trip contact)

NOTICE!

A single-phase current (IL1, IL2 or IL3) is enough to prolong or release the blocking during an overcurrent condition.

8.2.3 Monitoring functions

8.2.3.1 Current transformer supervision

Table. 8.2.3.1 - 263. Technical data for the current transformer supervision function.

Measurement inputs	
Current inputs	Phase current inputs: IL1 (A), IL2 (B), IL3 (C) Residual current channel I ₀₁ (Coarse) (optional) Residual current channel I ₀₂ (Fine) (optional)
Current input magnitudes	RMS phase currents RMS residual current (I ₀₁ , I ₀₂) (optional)
Pick-up	
Pick-up current settings: - ISET high limit - ISET low limit - ISUM difference - ISET ratio - I2/I1 ratio	0.10...40.00 × I _N , setting step 0.01 × I _N 0.10...40.00 × I _N , setting step 0.01 × I _N 0.10...40.00 × I _N , setting step 0.01 × I _N 0.01...100.00 %, setting step 0.01 % 0.01...100.00 %, setting step 0.01 %
Inaccuracy: - Starting IL1, IL2, IL3 - Starting I2/I1 - Starting I ₀₁ (1 A) - Starting I ₀₂ (0.2 A)	±0.5 %I _{SET} or ±15 mA (0.10...4.0 × I _{SET}) ±1.0 %I _{2SET} / I _{1SET} or ±100 mA (0.10...4.0 × I _N) ±0.5 %I _{0SET} or ±3 mA (0.005...10.0 × I _{SET}) ±1.5 %I _{0SET} or ±1.0 mA (0.005...25.0 × I _{SET})
Time delay for alarm	
Definite time function operating time setting	0.000...1800.000 s, setting step 0.005 s
Inaccuracy_ - Definite time (I_M/I_{SET} ratio > 1.05)	±2.0 % or ±80 ms
Instant operation time (alarm): - I_M/I_{SET} ratio > 1.05	<80 ms (<50 ms in differential protection relays)
Reset	

Reset ratio	97/103 % of the pick-up current setting
Instant reset time and start-up reset	<80 ms (<50 ms in differential protection relays)

8.2.3.2 Circuit breaker wear monitoring

Table. 8.2.3.2 - 264. Technical data for the circuit breaker wear monitoring function.

Pick-up	
Breaker characteristics settings: - Nominal breaking current - Maximum breaking current - Operations with nominal current - Operations with maximum breaking current	0.00...100.00 kA, setting step 0.001 kA 0.00...100.00 kA, setting step 0.001 kA 0...200 000 operations, setting step 1 operation 0...200 000 operations, setting step 1 operation
Pick-up setting for Alarm 1 and Alarm 2	0...200 000 operations, setting step 1 operation
Inaccuracy	
Inaccuracy for current/operations counter: - Current measurement element - Operation counter	$0.1 \times I_N > I < 2 \times I_N \pm 0.2 \%$ of the measured current, rest 0.5 % $\pm 0.5 \%$ of operations deducted

8.2.3.3 Current total harmonic distortion

Table. 8.2.3.3 - 265. Technical data for the total harmonic distortion function.

Input signals	
Current inputs	Phase current inputs: I_{L1} (A), I_{L2} (B), I_{L3} (C) Residual current channel I_{01} (Coarse) Residual current channel I_{02} (Fine)
Current input magnitudes	Current measurement channels (FFT result) up to the 31 st harmonic component.
Pick-up	
Operating modes	Power THD Amplitude THD
Pick-up setting for all comparators	0.10...200.00 % , setting step 0.01 %
Inaccuracy	$\pm 3 \%$ of the set pick-up value $> 0.5 \times I_N$ setting; $5 \text{ mA} < 0.5 \times I_N$ setting.
Time delay	
Definite time function operating time setting for all timers	0.000...1800.000 s, setting step 0.005 s
Inaccuracy: - Definite time operating time - Instant operating time, when I_M/I_{SET} ratio > 3 - Instant operating time, when I_M/I_{SET} ratio $1.05 < I_M/I_{SET} < 3$	$\pm 0.5 \%$ or $\pm 10 \text{ ms}$ Typically $< 20 \text{ ms}$ Typically $< 25 \text{ ms}$

Reset	
Reset time	Typically <10 ms
Reset ratio	97 %

8.2.3.4 Disturbance recorder

Table. 8.2.3.4 - 266. Technical data for the disturbance recorder function.

Recorded values	
Recorder analog channels	0...20 channels Freely selectable
Recorder digital channels	0...95 channels Freely selectable analog and binary signals 5 ms sample rate (FFT)
Performance	
Sample rate	8, 16, 32 or 64 samples/cycle
Recording length	0.000...1800.000 s, setting step 0.001 s The maximum length is determined by the chosen signals.
Number of recordings	0...100, 60 MB of shared flash memory reserved The maximum number of recordings according to the chosen signals and operation time setting combined

8.2.3.5 Event logger

Table. 8.2.3.5 - 267. Technical data for the event logger function.

General information	
Event history capacity	15 000 events
Event timestamp resolution	1 ms

8.3 Tests and environmental

Electrical environment compatibility

Table. 8.3 - 268. Disturbance tests.

All tests	CE-approved and tested according to EN 60255-26
Emissions	
Conducted emissions: EN 60255-26 Ch. 5.2, CISPR 22	150 kHz...30 MHz

Radiated emissions: EN 60255-26 Ch. 5.1, CISPR 11	30...1 000 MHz
Immunity	
Electrostatic discharge (ESD): EN 60255-26, IEC 61000-4-2	Air discharge 15 kV Contact discharge 8 kV
Electrical fast transients (EFT): EN 60255-26, IEC 61000-4-4	Power supply input 4 kV, 5/50 ns, 5 kHz Other inputs and outputs 4 kV, 5/50 ns, 5 kHz
Surge: EN 60255-26, IEC 61000-4-5	Between wires 2 kV, 1.2/50 μ s Between wire and earth 4 kV, 1.2/50 μ s
Radiated RF electromagnetic field: EN 60255-26, IEC 61000-4-3	f = 80....1 000 MHz, 10 V/m
Conducted RF field: EN 60255-26, IEC 61000-4-6	f = 150 kHz....80 MHz, 10 V (RMS)

Table. 8.3 - 269. Voltage tests.

Dielectric voltage test	
EN 60255-27, IEC 60255-5, EN 60255-1	2 kV (AC), 50 Hz, 1 min
Impulse voltage test	
EN 60255-27, IEC 60255-5	5 kV, 1.2/50 μ s, 0.5 J

Physical environment compatibility

Table. 8.3 - 270. Mechanical tests.

Vibration test	
EN 60255-1, EN 60255-27, IEC 60255-21-1 Class 1	2...13.2 Hz, \pm 3.5 mm 13.2...100 Hz, \pm 1.0 g
Shock and bump test	
EN 60255-1, EN 60255-27, IEC 60255-21-2 Class 1	20 g, 1 000 bumps/direction.

Table. 8.3 - 271. Environmental tests.

Damp heat (cyclic)	
EN 60255-1, IEC 60068-2-30	Operational: +25...+55 °C, 93...97 % (RH), 12+12h
Dry heat	
EN 60255-1, IEC 60068-2-2	Storage: +70 °C, 16 h Operational: +55 °C, 16 h
Cold test	

EN 60255-1, IEC 60068-2-1	Storage: -40 °C, 16 h Operational: -20 °C, 16 h
---------------------------	--

Table. 8.3 - 272. Environmental conditions.

IP classes	
Casing protection class	IP54 (front) IP21 (rear)
Temperature ranges	
Ambient service temperature range	-35...+70 °C
Transport and storage temperature range	-40...+70 °C
Other	
Altitude	<2000 m
Overvoltage category	III
Pollution degree	2

Casing and package

Table. 8.3 - 273. Dimensions and weight.

Without packaging (net)	
Dimensions	Height: 117 mm (4U) Width: 127 mm (¼ rack) Depth: 174 mm (no cards & connectors)
Weight	1.5 kg
With packaging (gross)	
Dimensions	Height: 170 mm Width: 242 mm Depth: 219 mm
Weight	2 kg

9 Ordering information

		AQ - T 2 1 6 - P X X X A X A - X X											
Model													
T	Transformer protection												
Device size													
1	1/4 of 19" rack												
Analog measurement													
6	10 Current measurement channels												
Mounting													
P	Panel mounted												
Auxiliary voltage													
H	80...265 VAC/DC												
L	18...72 VDC												
Measurement accuracy													
8	N/A												
Terminals													
A	Standard												
B	Ring-lug current terminals												
C	Standard current terminals, spring cage I/O terminals												
D	Ring-lug current terminals, spring cage I/O terminals												
Reserved for future use													
A	N/A												
Digital inputs on power supply module													
A	3 Digital inputs, 24 V nominal threshold												
B	3 Digital inputs, 110 V nominal threshold												
C	3 Digital inputs, 220 V nominal threshold												
D	2 Digital inputs, 24 V nominal threshold												
E	2 Digital inputs, 110 V nominal threshold												
F	2 Digital inputs, 220 V nominal threshold												
Reserved for future use													
A	N/A												
Slots E, F (2 pcs)													
A	Empty												
B	8 Digital inputs												
C	5 Output relays (max. 2 pcs)												
D	Arc protection with 4 point sensor channels, 2 x HSO, 1 x BI (max. 1 pcs)												
F	8 x RTD input (max. 2 pcs)												
G	2 x RJ-45 100Mb Ethernet & IRIG-B (max. 1 pcs) *												
H	2 x ST 100Mb Ethernet & IRIG-B (max. 1 pcs) *												
I	4 x mA outputs - 1 x mA input (max. 2 pcs)												
J	Double LC 100Mb Ethernet (HSR, PRP redundant protocols) (max. 1 pcs) * / **												
K	Double RJ45 100Mb Ethernet (HSR, PRP redundant protocols) (max. 1 pcs) *												
L	RS-232 - Serial fiber (Plastic-Plastic) (max. 1 pcs) *												
M	RS-232 - Serial fiber (Plastic-Glass) (max. 1 pcs) *												
N	RS-232 - Serial fiber (Glass-Plastic) (max. 1 pcs) *												
O	RS-232 - Serial fiber (Glass-Glass) (max. 1 pcs) *												

* Can only be applied to the last slot

** Can't be applied when type "L" (18...72 VDC) auxiliary voltage is selected

Accessories

Order code	Description	Note
------------	-------------	------

AX007	External 6-channel 2 or 3 wires RTD Input module, pre-configured	Requires an external 24 VDC supply.
AX008	External 8-ch Thermocouple mA Input module, pre-configured	Requires an external 24 VDC supply.
AQX009	Raising frame 87 mm	-
AX010	Raising frame 40 mm	-
AQX011	AQ-210 series combiflex frame	-
AQX012	AQ-210 series wall mounting bracket	-
AQ-01A	Light point sensor unit (8,000 lux threshold)	Max. cable length 200 m
AQ-01B	Light point sensor unit (25,000 lux threshold)	Max. cable length 200 m
AQ-01C	Light point sensor unit (50,000 lux threshold)	Max. cable length 200 m
AQ-02A	Pressure and light point sensor unit (8,000 lux threshold)	Max. cable length 200 m
AQ-02B	Pressure and light point sensor unit (25,000 lux threshold)	Max. cable length 200 m
AQ-02C	Pressure and light point sensor unit (50,000 lux threshold)	Max. cable length 200 m

10 Contact and reference information

Manufacturer

Arcteq Relays Ltd.

Visiting and postal address

Kvartsikatu 2 A 1
65300 Vaasa, Finland
